Received 11 February 2009; accepted 19 February 2009

Key indicators: single-crystal synchrotron study;  $T = 120$  K; mean  $\sigma(\text{C}-\text{C}) = 0.007 \text{ \AA}$ ;  $R$  factor = 0.045;  $wR$  factor = 0.098; data-to-parameter ratio = 30.2.

The title compound,  $[\text{Co}(\text{C}_{10}\text{H}_{21}\text{N}_2)\text{Cl}_3]$ , was obtained as the by-product of the attempted synthesis of a cobalt sulfate framework using 1,4-diazabicyclo[2.2.2]octane as an organic template. The asymmetric unit comprises two distinct molecules, and in each, the cobalt(II) ions are tetrahedrally coordinated by three chloride anions and one 1-butyl-diazabicyclo[2.2.2]octan-1-ium cation. The organic ligands are generated *in situ*, and exhibit two forms differentiated by the eclipsed and staggered conformations of the butyl groups. These molecules interact by way of  $\text{C}-\text{H}\cdots\text{Cl}$  hydrogen bonds, forming a three-dimensional hydrogen-bonding array.

## Related literature

Examples of closely related structures are *N*-methyl-1,4-diazabicyclo(2.2.2) octonium trichloro-aqua-nickel(II) (Ross & Stucky, 1969) and *N,N'*-dimethyl-1,4-diazaniabicyclo[2.2.2]-octane tetrachlorocobaltate ( $\text{C}_8\text{H}_{18}\text{N}_2$ )[ $\text{CoCl}_4$ ] (Qu & Sun, 2005). The organic cation in both structures do not coordinate to the cobalt ion but, in each case, the  $\text{C}-\text{H}\cdots\text{Cl}$  hydrogen-bonding interactions are similar to those in the title compound. For hydrogen bonding in related structures, see: Bremner & Harrison (2003).

## (1-Butyl-1,4-diazabicyclo[2.2.2]octon-1-ium- $\kappa N^4$ )trichloridocobalt(II)

S. Luachan, B. Yotnoi, T. J. Prior and A. Rujiwatra

### Comment

The crystals of  $\text{Co}(\text{C}_{10}\text{H}_{21}\text{N}_2)\text{Cl}_3$  (**I**) were unintentionally obtained as a by-product from the hydrothermal reaction between cobalt(II) sulfate heptahydrate and 1,4-diazabicyclo[2.2.2]octane in a water/butan-1-ol mixture. The *N*-butyl-1,4-diazabicyclo[2.2.2]octanium ligand was presumably generated *in situ* under acidic conditions. The structure of **I** is built up from two distinct  $[\text{Co}(\text{C}_{10}\text{H}_{21}\text{N}_2)\text{Cl}_3]$  molecules as shown in Fig. 1. They are different in the spatial orientation of the butyl group of the *N*-butyl-1,4-diazabicyclo[2.2.2]octanium ligand, one of which is in the eclipsed conformation (**A**) and the other is in the staggered conformation (**B**). The **A** molecules are connected by the  $\text{C}-\text{H}\cdots\text{Cl}$  hydrogen bonding interactions to form a two-dimensional **A** sheet in the *ab* plane (Fig. 2), whereas the **B** molecules form the **B** sheet also in the *ab* plane using similar  $\text{C}-\text{H}\cdots\text{Cl}$  hydrogen bonding interactions (Fig. 3). The **A** and **B** sheets are then regularly alternated in the **ABAB** fashion, and linked by way of also the  $\text{C}-\text{H}\cdots\text{Cl}$  hydrogen bonding interactions along *c* to give the infinite three-dimensional hydrogen bonding array (Fig. 4).

The hydrogen bond geometries found in **I** ( $\text{H}\cdots\text{Cl}$ , 2.62–2.81 Å;  $\text{C}\cdots\text{Cl}$ , 3.485 (4)–3.739 (4) Å;  $\text{C}-\text{H}\cdots\text{Cl}$ , 140.00–164.00°) are well comparable to those found in related structures, *e.g.*  $(\text{C}_6\text{H}_{14}\text{N}_2)[\text{CoCl}_4]$  (Bremner & Harrison, 2003) and  $(\text{C}_8\text{H}_{18}\text{N}_2)[\text{CoCl}_4]$  (Qu & Sun, 2005).

### Experimental

Crystals of **I** were obtained as a by-product from the hydrothermal reaction of cobalt(II) sulfate heptahydrate, 1,4-diazabicyclo[2.2.2]octane and hydrochloric acid in a water/butan-1-ol mixture at 453 K for 120 h.

### Refinement

H atoms were placed in calculated positions with  $\text{C}-\text{H} = 0.99\text{Å}$  or  $0.98\text{Å}$  for methyl H atoms and were included in the refinement in a riding-model approximation with  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$  or  $1.5U_{\text{eq}}(\text{C})$  for methyl H atoms.

The examined crystal was found to be twinned, composing of two crystal components which were miss-set by about two degrees. The crystal was therefore treated as a twin and the two components integrated separately using the same unit cell. Both components were used for the structure refinement and the twin fraction was found to be 0.698:0.302 (1).

Three alerts from checkCIF:

PLAT220\_ALERT\_2\_C

PLAT222\_ALERT\_2\_C

## supplementary materials

---

The rather weak van der Waals interactions involving the *n*-butyl chains mean there is considerable freedom for these carbon and hydrogen atoms to vibrate. The slightly enlarged displacement parameters observed are entirely expected on chemical grounds.

PLAT341\_ALERT\_3\_C

The calculated estimated standard uncertainties associated with the unit-cell parameters are faithfully reproduced from the Bruker APEXII suite (Bruker, 2004). All observed data were used in their calculation. These give rise to moderate precision in the C—C bonds. To some extent this is a consequence of the integration procedure which uses two twin components - deconvolution of the low angle components is problematic as the two components are miss-set by approximately 2°.

*Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations

## supplementary materials

---

between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
