Received 17 February 2009; accepted 19 February 2009

Key indicators: single-crystal X-ray study; $T = 291$ K; mean $\sigma(\text{C}-\text{C}) = 0.003$ Å; R factor = 0.031; wR factor = 0.096; data-to-parameter ratio = 17.3.

In the title compound, $\{[\text{Co}(\text{C}_{10}\text{H}_{14}\text{N}_4)_2(\text{H}_2\text{O})_2](\text{NO}_3)_2\}_n$, the Co^{II} ion lies on an inversion center and is six-coordinated in an octahedral environment by four N atoms from four different 1,1'-butane-1,4-diyl diimidazole ligands and two O atoms from the two water molecules. The Co^{II} atoms are bridged by ligands, generating a two-dimensional (4,4)-network. Adjacent fishnet planes are linked to the nitrate anions *via* $\text{O}-\text{H}\cdots\text{O}$ hydrogen bonds, forming a three-dimensional supramolecular structure.

Comment

The 1,1'-butane-1,4-diyl diimidazole as a flexible ligand exhibit a variety of supramolecular aggregation patterns (Ma *et al.*, 2003; Dong *et al.*, 2006; Yu *et al.*, 2008). In this paper, we report the new title compound, (I), synthesized by the reaction of 1,1'-butane-1,4-diyl diimidazole ligand and cobalt dinitrate in aqua solution.

In (I), each Co^{II} atom is located on an inversion centre and is six-coordinated in an octahedral environment by four N atoms from four different 1,1'-butane-1,4-diyl diimidazole ligands and two O atoms from the two water molecules (Fig. 1). The Co—N and Co—O distances are normal (Table 1). The Co^{II} atoms are bridged by ligands, generating a two-dimensional (4,4)-network (Fig. 2).

In the crystal, a $R_4^4(12)$ motif is built up by O—H...O hydrogen bonding interaction between the uncoordinated nitrate anions and the coordinated water molecules, which links the adjacent fishnet planes to a three-dimensional supramolecular structure (Fig. 3, Table 2).

Experimental

1,1'-Butane-1,4-diyl diimidazole ligand was prepared from imidazole and 1,4-dibromobutane in DMSO (Ma *et al.*, 2003a). 1,1'-Butane-1,4-diyl diimidazole (0.76 g, 4 mmol) and cobalt dinitrate (0.73 g, 4 mmol) were dissolved in hot aqua solution (10 ml) to give a clear solution. The resulting solution was allowed to stand in a desiccator at room temperature for a week, pink crystals of (I) were obtained.

Refinement

H atoms bound to C atoms were placed in calculated positions and treated as riding on their parent atoms, with C—H = 0.93 Å (aromatic), C—H = 0.97 Å (methylene), and with $U_{iso}(H) = 1.2U_{eq}(C)$. Water H atoms were initially located in a difference Fourier map, but they were treated as riding on their parent atoms with O—H = 0.85 Å and with $U_{iso}(H) = 1.5U_{eq}(O)$.

Figures

Fig. 1. The molecular structure of (I), showing displacement ellipsoids at the 30% probability level for non-H atoms. Dashed lines indicate the hydrogen-bonding interactions [Symmetry code: (I) $-x + 1, -y, -z + 1$; (II) $-x + 1, -y + 2, -z + 2$; (III) $-x, -y + 1, -z + 1$]

Fig. 2. A partial packing view, showing the two-dimensional (4,4)-network. Dashed lines indicate the hydrogen-bonding interactions and no involving H atoms have been omitted.

Fig. 3. A Partial packing view, showing the three-dimensional supramolecular structure. Dashed lines indicate the hydrogen-bonding interactions and no involving H atoms have been omitted.

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
