Received 27 January 2009; accepted 24 February 2009

Key indicators: single-crystal X-ray study; $T = 100\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.007\text{ \AA}$; disorder in main residue; R factor = 0.055; wR factor = 0.132; data-to-parameter ratio = 23.0.

In the title compound, $[\text{Cd}(\text{C}_{14}\text{H}_{14}\text{N}_3\text{O}_2)_2(\text{CH}_3\text{OH})_2]$, each cadmium(II) center is six-coordinated by an N atom and an O atom of two 1,3-bis(2-methoxyphenyl)triazenido ligands and by the O atoms of two methanol molecules. The distorted octahedral coordination geometry of the Cd atom has two N and two O atoms in the equatorial plane, and two O atoms in axial positions. The complex is stabilized by intramolecular $\text{O}-\text{H}\cdots\text{O}$ and $\text{O}-\text{H}\cdots\text{N}$ hydrogen bonds. In the crystal structure the complexes are linked into chains *via* intermolecular $\text{C}-\text{H}\cdots\pi$ stacking interactions. One of the methanol C atoms is disordered with occupancies of 0.7:0.3.

trans-Bis[1,3-bis(2-methoxyphenyl)triazenido]dimethanolcadmium(II)

Mohammad Kazem Rofouei, Mohammad Reza Melardi, Hamid Reza Khalili Ghaydari and Mohammad Barkhi

S1. Comment

Recently, we have reported on the crystal structures of silver(I), copper(I), and mercury(II) complexes of the ligand [1,3-di(2-methoxy)benzene]triazene (Payehghadr *et al.*, 2006; Rofouei & Hashempur 2008; Rofouei, Melardi *et al.*, 2008). Here we report on the crystal structure of the cadmium(II) complex of the same ligand.

The molecular structure of the title complex is illustrated in Fig. 1. A view along the *a* axis of the crystal packing is given in Fig. 2. The title complex crystallizes in the non-centrosymmetric space group $P2_12_12_1$; the Flack X factor is 0.04 (3). Each cadmium(II) center is six-coordinated by an N-atom and an O-atom of two [1,3-di(2-methoxy)benzene]-triazene ligands, and by the O-atom of two molecules of methanol. The octahedral coordination geometry of the cadmium atom has two N- and two O-atoms in the equatorial plane, and two O-atoms in axial positions. The Cd—N and Cd—O bond lengths are in the expected range for such coordination bonds.

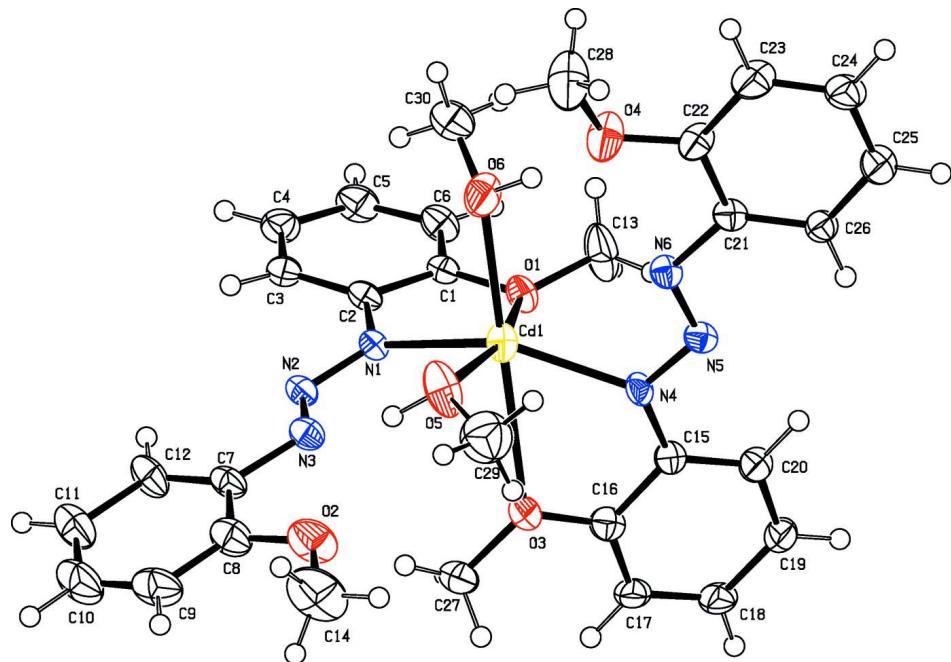

The complex is stabilized by intramolecular O—H \cdots O and O—H \cdots N hydrogen bonds (Table 1). Another noticeable feature of the title compound is the presence of C—H \cdots π stacking interactions (Fig. 3 and Table 1).

S2. Experimental

The synthesis of the ligand 1,3-bis(2-methoxybenzene)triazene has been reported previously (Rofouei, Shamsipur *et al.*, 2006). For the preparation of the cadmium(II) complex a solution of cadmium acetate monohydrate (248 mg, 1 mmol) in methanol (10 ml) was carefully added to a solution of 1,3-bis(2-methoxybenzene)triazene, (514 mg, 2 mmol) in dichloromethane (20 ml) with stirring at 40 °C. The solution was then cooled to rt and after several days needle-like red crystals of the title compound were isolated (yield; 550 mg, 80%).

S3. Refinement

The OH H-atoms could be located in difference Fourier syntheses, and were refined as riding: O—H = 0.86 - 0.91 Å with $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{parent O-atom})$. The C-bound H-atoms were included in calculated positions and treated as riding: C—H = 0.95 - 0.98 Å with $U_{\text{iso}}(\text{H}) = 1.2$ or $1.5U_{\text{eq}}(\text{parent C-atom})$.

H-atom parameters constrained

$w = 1/[\sigma^2(F_o^2) + (0.0582P)^2 + 7.7532P]$
where $P = (F_o^2 + 2F_c^2)/3$

$(\Delta/\sigma)_{\max} = 0.001$

$\Delta\rho_{\max} = 2.65$ e Å⁻³

$\Delta\rho_{\min} = -2.09$ e Å⁻³

Absolute structure: Flack (1983), 4009 Friedel pairs

Absolute structure parameter: 0.04 (3)

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
