Received 15 March 2009; accepted 25 March 2009

Key indicators: single-crystal X-ray study;  $T = 295\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.002\text{ \AA}$ ;  $R$  factor = 0.037;  $wR$  factor = 0.108; data-to-parameter ratio = 14.9.

In the title compound,  $\text{C}_{15}\text{H}_{14}\text{O}_2$ , the plane of the central  $-\text{C}(=\text{O})-\text{O}-$  group is inclined at an angle of  $3.7(2)^\circ$  with respect to the benzoate ring. The two benzene rings are almost perpendicular, making a dihedral angle of  $87.4(1)^\circ$ . In the crystal, molecules are packed into infinite chains through weak  $\text{C}-\text{H} \cdots \pi$  interactions.

## 2,5-Dimethylphenyl benzoate

B. Thimme Gowda, Miroslav Tokarčík, Jozef Kožíšek, P. A. Suchetan and Hartmut Fuess

### S1. Comment

As part of a study of the substituent effects on the solid state geometries of aryl benzoates (Gowda *et al.*, 2008*a, b*), in the present work, the structure of 2,5-dimethylphenyl benzoate (25DMPBA) has been determined. The structure of 25DMPBA (Fig. 1) is similar to those of 2,3-dimethylphenyl benzoate (23DMPBA) (Gowda *et al.*, 2008*a*), 2,4-dimethylphenyl benzoate (24DMPBA) (Gowda *et al.*, 2008*b*) and other aryl benzoates. The plane of central  $\text{O}=\text{C}=\text{O}$  group in 25DMPBA makes the dihedral angle of  $3.7(2)^\circ$  with respect to the benzoate ring, compared with the value of  $5.7(1)^\circ$  in the structure of 24DMPBA. The two aromatic rings in 25DMPBA form a dihedral angle of  $87.4(1)^\circ$ , in comparison with the corresponding angle of  $80.3(1)^\circ$  in 24DMPBA. The other bond parameters in 25DMPBA are similar to those in 23DMPBA, 24DMPBA and other aryl benzoates.

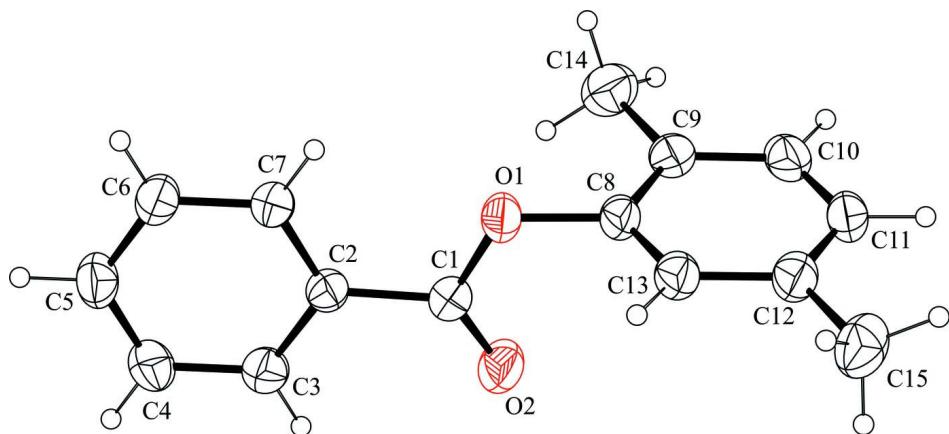

The molecules in the structure are packed into infinite chains through weak  $\text{C}-\text{H}\cdots\pi$  interactions between some H atoms of the phenyl ring and the benzoate ring centroids. The first intermolecular interaction includes the atoms C3, H3 and the benzoate ring centroid CT1 at the symmetry position ( $x-1, y, z$ ). The second interaction includes C6, H6 and the benzoate ring centroid CT1 at the position ( $x, -y+3/2, z+1/2$ ) (Fig. 2).

### S2. Experimental

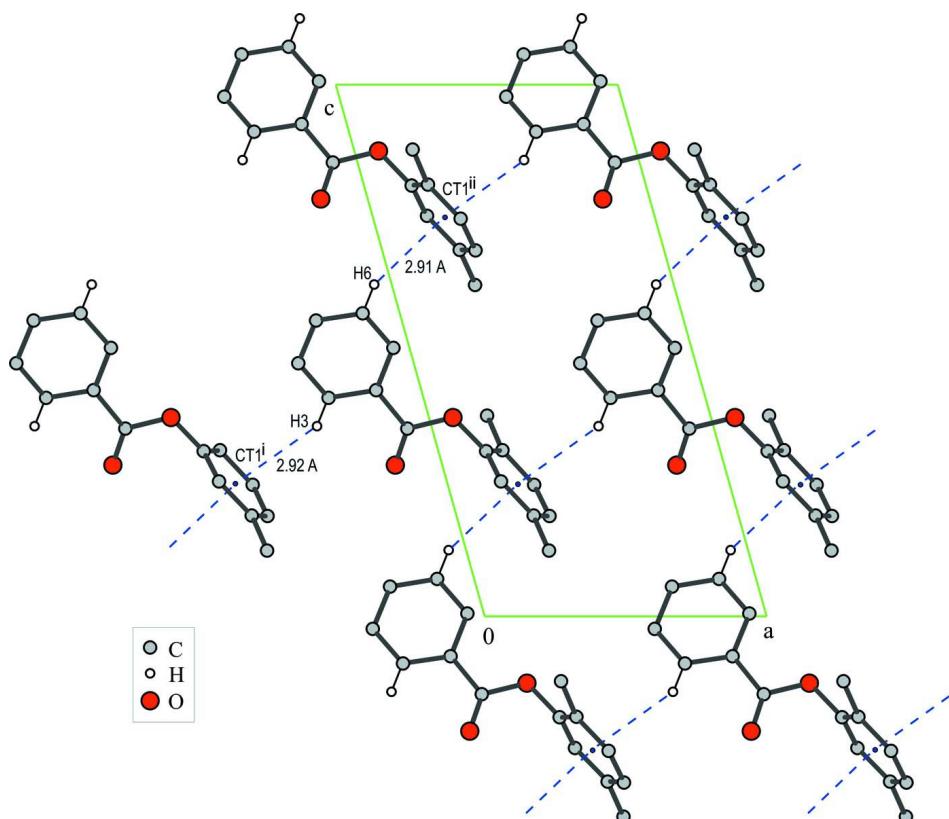

The title compound was prepared according to a literature method (Nayak & Gowda, 2009). The purity of the compound was checked by determining its melting point. It was characterized by recording its infrared and NMR spectra (Nayak & Gowda, 2009). Single crystals of the title compound were obtained by slow evaporation of its ethanol solution. The X-ray diffraction studies were made at room temperature.

### S3. Refinement

H atoms were positioned geometrically and refined within a riding model with  $\text{C}-\text{H}$  distances of  $0.93$  or  $0.96$  Å and  $U_{\text{iso}}(\text{H}) = 1.2$  (1.5 for methyl) times  $U_{\text{eq}}(\text{C})$ . Methyl groups were refined as freely rotating groups, using HFIX 137 command.

**Figure 1**

Molecular structure of (I) showing the atom labelling scheme. Displacement ellipsoids are drawn at the 30% probability level. H atoms are represented as small spheres of arbitrary radii.

**Figure 2**

Part of the crystal structure of (I) viewed down the *b* axis. Infinite chains generated via C-H $\cdots\pi$  interactions are shown as dotted lines. CT1 is the benzoate ring (C8 to C13) centroid. H atoms not involved in hydrogen bonding were omitted. [Symmetry codes: (i)  $x-1, y, z$ ; (ii)  $x, -y+3/2, z+1/2$ ].

*Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
