Received 27 February 2009; accepted 28 February 2009

 Key indicators: single-crystal X-ray study; $T = 293\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.002\text{ \AA}$; R factor = 0.031; wR factor = 0.086; data-to-parameter ratio = 16.3.

In the title compound, $[\text{Co}(\text{C}_{12}\text{H}_{15}\text{O}_4)_2(\text{H}_2\text{O})_2]_n$, adjacent Co^{II} atoms ($\bar{1}$ symmetry) are bridged by 3-carboxyadamantane-1-carboxylate anions, forming a chain running along $[001]$. Interchain $\text{O}-\text{H}\cdots\text{O}$ hydrogen bonds link the chains into layers parallel to (100) ; the layers are further connected *via* interlayer hydrogen bonds interactions, forming a three-dimensional framework.

Comment

The Cambridge Structural Database (Version 5.30, February 2009) lists few examples of metal (II) adamantane-1,3-dicarboxylates (Nielsen *et al.*, 2008; Zhao *et al.*, 2007). The dicarboxylate group is rigid, much more different from the aliphatic dicarboxylic acids (Zheng *et al.*, 2008), effected severely by spacial steric hindrance. The asymmetric unit of the title compound consists of one Co^{2+} cation, one aqua ligand and one Hadc^- anion (H_2adc = adamantane-1,3-dicarboxylic acid) (Fig.1). The Co atoms at the Wckoff 4a sites are crystallographically imposed by inversion center and are each located in an elongated octahedral coordination sphere defined by two aqua ligands and four carboxylate oxygen atoms from four 3-carboxyadamantane-1-carboxylate anions. The axial Co—O bond distances averaged at 2.106 (1) Å are slightly longer than the equatorial ones of 2.078 (1) Å. The *trans*- and *cisoid* O—Co—O angles fall in the regions 88.49 (5)–91.51 (5)° and 180°, respectively, exhibiting slight deviation from the corresponding values for a regular geometry (Table 1). Each carboxylate anion monodentately coordinates one Co^{2+} ion in *syn* fashion. Interestingly, one of the two carboxylate anions from each ligand is protonated and coordinates one Co^{2+} ion by carbonyl oxygen atom, which is rare in former reports. The Co^{2+} ions are bridged by 3-carboxyadamantane-1-carboxylate anions to form one-dimensional chains running along the [001] direction. On the basis of the interchain O—H \cdots O hydrogen bonds (Table 2), these chains are assembled into layers parallel to (100) (Fig.2). The layers are further connected to form a three-dimensional framework *via* interlayer hydrogen bonds interaction.

Experimental

Adamantane-1,3-dicarboxylic acid (H_2adc) (0.0666 g, 0.3 mmol), 1 M NaOH (0.5 ml, 0.5 mmol) was consequently added to 15 ml aqueous solution, then the mixture was heated constantly at 90 °C and stirred for 30 min, yielding colorless solution, to which was added $\text{CoCl}_2 \cdot 6\text{H}_2\text{O}$ (0.2485 g, 1.0 mmol) and continually stirred for 30 min, then the purple solution (pH = 5.12) was cooled to room temperature and laid undisturbed, purple block-like crystals were afforded after two weeks.

Refinement

H atoms bonded to C atoms were placed in geometrically calculated position and were refined using a riding model, with $U_{\text{iso}}(\text{H}) = 1.2 U_{\text{eq}}(\text{C})$. H atoms attached to O atoms were found in a difference Fourier synthesis and were refined using a riding model, with the O—H distances fixed as initially found and with $U_{\text{iso}}(\text{H})$ values set at $1.2 U_{\text{eq}}(\text{O})$.

Figures

Primary atom site location: structure-invariant direct methods	$\Delta\rho_{\min} = -0.30 \text{ e } \text{\AA}^{-3}$
	Extinction correction: none

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
