Received 12 March 2009; accepted 14 March 2009

Key indicators: single-crystal X-ray study; $T = 295$ K; mean $\sigma(C-C) = 0.002$ Å;
 R factor = 0.025; wR factor = 0.071; data-to-parameter ratio = 13.9.

In the crystal structure of the title compound, $[Na_4Ni(C_8H_3O_7S)_2(H_2O)_{12}]_n$, the Ni^{II} cation occupies an inversion centre and is coordinated by the carboxyl groups of the sulfoisophthalate trianions and water molecules in a distorted octahedral geometry. Two independent Na^I atoms are connected by the carboxyl and sulfonate groups of the sulfoisophthalate ligands anions and water molecules in a distorted octahedral geometry. The sulfoisophthalate ligands and coordinated water molecules bridge the Ni^{II} and Na^I cations, forming a three-dimensional polymeric structure. Weak $\pi-\pi$ stacking is present between parallel benzene rings [centroid-centroid distance = 3.9349 (10) Å]. Extensive O—H···O and C—H···O hydrogen bonding helps to stabilize the crystal structure.

S1. Comment

As a part of investigation on π – π stacking between aromatic rings (Su & Xu, 2004; Pan *et al.*, 2006), the title Ni^{II} compound has recently been prepared in our laboratory, and its crystal structure is reported here.

A part of the three dimensional polymeric structure of the title compound is shown in Fig. 1. The Ni^{II} compound is isomorphous with the Co^{II} compound (Zhang *et al.*, 2009). The Ni atom occupies a special position in an inversion centre and assumes a distorted NiO₆ octahedral geometry. The Ni—O bond distances (Table 1) are about 0.03 Å shorter than corresponding Co—O bond distances found in the isomorphous Co^{II} compound. Both crystallographically independent Na^I atoms are in distorted octahedral coordination geometry. The sulfoisophthalate trianions and water molecules bridge the metal atoms to form the polymeric structure.

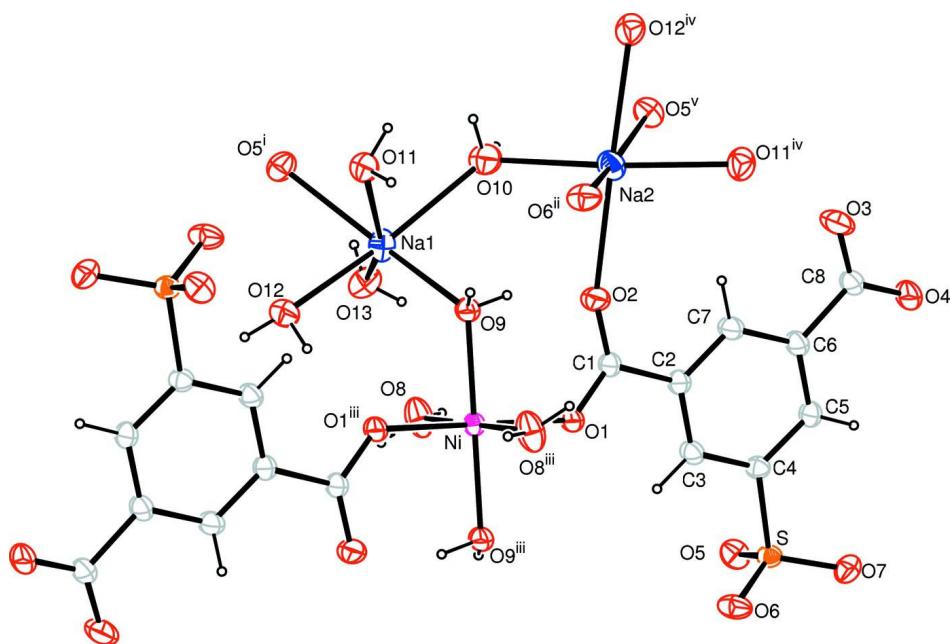

The extensive O—H···O hydrogen bonding network presents in the crystal structure (Table 2), weak C—H···O hydrogen bonding also helps to stabilize the crystal structure. The distance between parallel the C2-benzene plane and C2'-benzene plane is 3.551 (9) Å [symmetry code: (v) 1 - x , 1 - y , - z], and the centroids distance between the benzene rings is 3.9349 (10) Å. These findings suggest a weak π – π stacking involving sulfoisophthalate ligand.

S2. Experimental

A water-ethanol solution (25 ml, 3:2) containing monosodium 5-sulfoisophthalate (0.270 g, 1 mmol), Na₂CO₃ (0.212 g, 2 mmol) and NiCl₂·6H₂O (0.600 g, 2.5 mmol) was refluxed for 8 h and filtered after cooling to room temperature. The single crystals of the title compound were obtained from the filtrate after 3 weeks.

S3. Refinement

Water H atoms were located in a difference Fourier map and refined as riding in as-found relative positions, with $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{O})$. Other H atoms were placed in calculated positions with C—H = 0.93 Å and refined in riding mode with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$.

**Figure 1**

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
