Key indicators: single-crystal X-ray study;  $T = 153$  K; mean  $\sigma(C-C) = 0.005$  Å;  $R$  factor = 0.042;  $wR$  factor = 0.103; data-to-parameter ratio = 16.1.

The title compound,  $[Cu(C_7H_5O_2)(C_{18}H_{12}F_3P)_2]$ , a copper(I) tris(4-fluorophenyl)phosphine tropolonate derivative, is the first tropolonate complex with fluorinated arylphosphine ligands. The Cu<sup>I</sup> atom has a distorted tetrahedral coordination; the most important geometrical parameters of the molecule are: Cu–P = 2.2377 (10) and 2.2335 (15) Å, Cu–O = 2.084 (2) and 2.082 (2) Å, O–Cu–O = 77.72 (10)°, P–Cu–P = 128.82 (4)° and O–C–C–O = –2.1 (5)°.

### Related literature

The title compound is structurally related to the flavonolato and nitrosophenylhydroxylaminato derivatives (Speier *et al.*, 1990; Charalambous *et al.*, 1984). ## Bis[tris(4-fluorophenyl)phosphine- $\kappa P$ ](tropolonato- $\kappa^2 O, O'$ )copper(I)

G. Steyl

### Comment

Tropolone and its derivatives have been of interest ever since their first discovery in the early 1940's (Dewar, 1945); they are known to have applications in pharmacology (Hill & Steyl, 2008) and catalysis (Crous *et al.*, 2005). Recently, research in this area has been extended to include phosphine metal complexes and the effect tropolonato ligand has on the solid state and chemical behaviour of these complexes (Steyl, 2007; Steyl & Roodt, 2006; Roodt *et al.*, 2003). Only two other examples of copper triphenylphosphine complexes are known to date, which contain a five-membered O,O-bidentate chelating ring system, *i.e.*, the flavonolato and nitrosophenylhydroxylaminato derivatives (Speier *et al.*, 1990; Charalambous *et al.*, 1984). In this paper, the structure of tropolonato-bis[tri(4-fluorophenyl)phosphine]copper(I) complex is reported (Fig. 1).

The Cu—O and Cu—P bond distances are well within normal ranges; the bond angles at the Cu atom show significantly distorted tetrahedral coordination (Table 1). The bidentate bite angle O1—Cu—O2 77.72 (10)° is close to the analogous angles in the previously reported structures (Speier *et al.*, 1990; Charalambous *et al.*, 1984). The phosphine moieties adopt a staggered conformation, the C11—P1—Cu—O1 and C51—P2—Cu—O2 torsion angles being equal to -59.05 (14)° and -49.50 (14)°.

### Experimental

Sodium tropolonate (116 mg, 0.57 mmol) was added to dichloromethane solution (10 ml) of [Cu(P(p-C<sub>6</sub>H<sub>4</sub>F)<sub>3</sub>)<sub>2</sub>NO<sub>3</sub>] (396 mg, 0.57 mmol). On slow evaporation of the solvent, crystals suitable for X-Ray structural study were obtained. Yield: 300 mg (74%).

### Refinement

H atoms were positioned geometrically and refined using a riding model, with C—H = 0.95 Å and  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}$  of the carrier C atom.

*Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
