

Poly[diaqua(μ_3 -succinato)cadmium(II)]**Xuan-Wen Liu**

Department of Materials Science and Engineering, Northeastern University at Qinhuangdao, Qinhuangdao, Hebei 066000, People's Republic of China
Correspondence e-mail: liuxuanwen2009@163.com

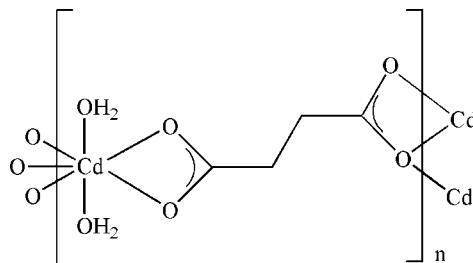

Received 6 March 2009; accepted 29 March 2009

Key indicators: single-crystal X-ray study; $T = 293$ K; mean $\sigma(\text{C}-\text{C}) = 0.005$ Å;
 R factor = 0.023; wR factor = 0.053; data-to-parameter ratio = 12.1.

The title compound, $[\text{Cd}(\text{C}_4\text{H}_4\text{O}_4)(\text{H}_2\text{O})_2]_n$, has been synthesized under hydrothermal conditions. The asymmetric unit consists of one Cd^{2+} cation, one succinate anion and two aqua ligands. The Cd atoms present a distorted pentagonal bipyramidal coordination and are bridged into layers parallel to (201) by succinate ligands.

Related literature

S1. Comment

The succinate dianion has been used as a bridging ligand in the preparation of multinuclear metal complexes. A variety of bridging modes have been found (Ng, 1998; Rastsvetaeva *et al.*, 1996; Brusau *et al.*, 2000; He *et al.*, 2006; He *et al.*, 2007). We report herein the synthesis and crystal structure of a new succinate complex $[\text{Cd}(\text{C}_4\text{H}_4\text{O}_4)(\text{H}_2\text{O})_2]$ (I).

The asymmetric unit consists of one Cd^{2+} cation, one succinate anion and two aqua ligand (Fig. 1). The Cd atom is coordinated by seven O atoms of three succinate anions and two aqua ligand, forming a distorted pentagonal bipyramidal coordination geometry (Table 1), with Cd—O bond lengths which agree well with those observed in analogous complexes (Huo *et al.*, 2005; Zhuo *et al.*, 2006). Cd atoms are bridged by succinate ligands into a two-dimensional layer (Fig. 2).

S2. Experimental

$\text{Cd}(\text{NO}_3)_2 \cdot 4\text{H}_2\text{O}$ (0.5 mmol, 0.154 g), succinic acid (0.5 mmol, 0.059 g), sodium hydroxide (1 mmol, 0.04 g) and water (12 ml) were placed in a 23-ml Teflon-lined Parr bomb. The bomb was heated at 453 K for 3 d. The colourless block-shaped crystals were filtered off and washed with water and acetone (yield 45%, based on Cd).

S3. Refinement

Water H atoms were located in a difference Fourier map and refined with restrained O—H (0.85 (1) Å) and free $U_{\text{iso}}(\text{H})$. H atoms on C atom were positioned geometrically and refined using a riding model, with C—H = 0.97 Å.

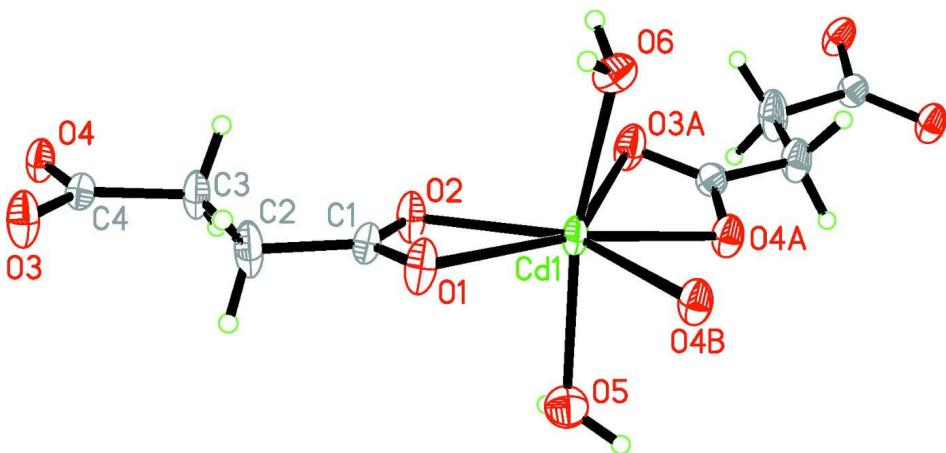

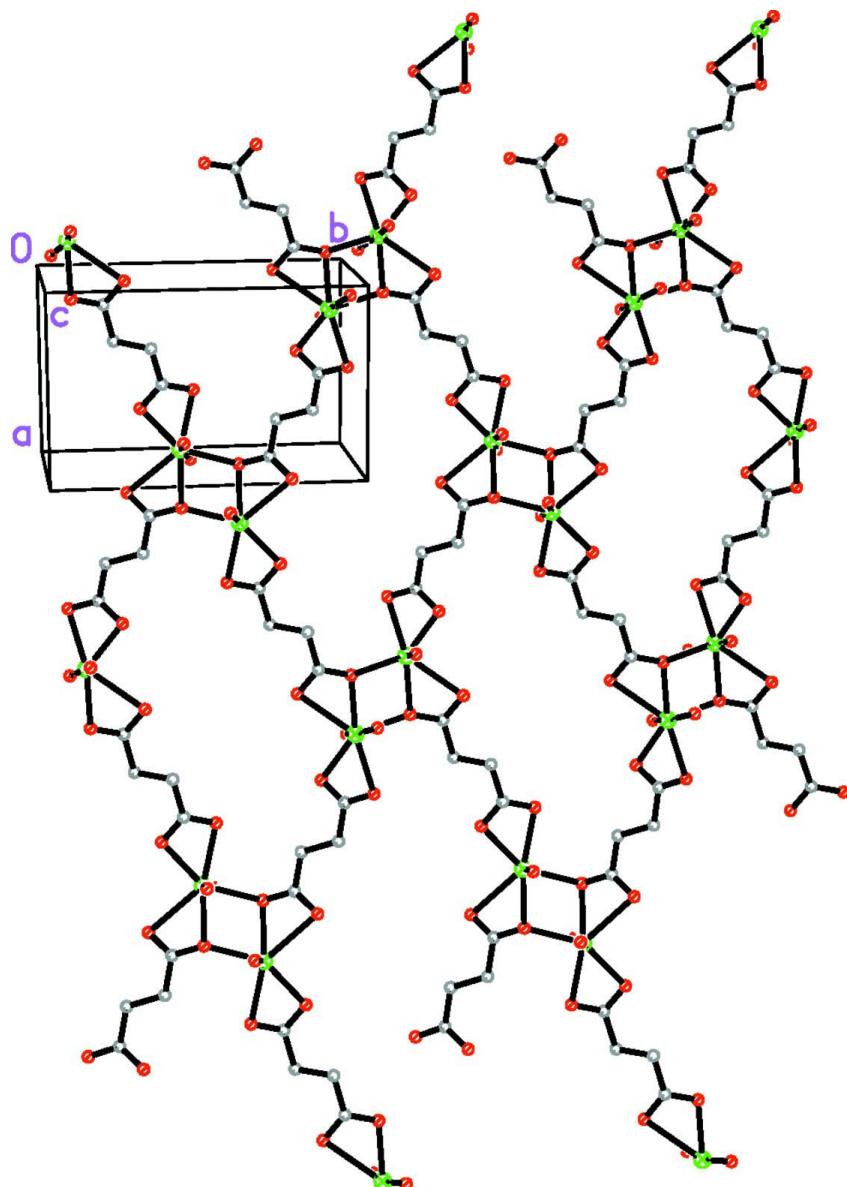

Figure 1

A view of the molecular structure of (I) with the atom-numbering scheme and 30% displacement ellipsoids. Atoms with the suffix A and B are generated by the symmetry operations $x + 1, -y + 3/2, z + 1/2$ and $-x + 2, -y + 1, -z + 2$, respectively.

**Figure 2**

The 2-D layer structure of compound (I) (H atoms of methylenes are omitted for clarity).

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
