

Bis(3-nitroanilinium) sulfate

Lingling Feng, Yubang Hou, Xuejian Yong and Feng Bao*

Department of Chemistry, Central China Normal University, Wuhan 430079,
People's Republic of China
Correspondence e-mail: baofengstorm@126.com

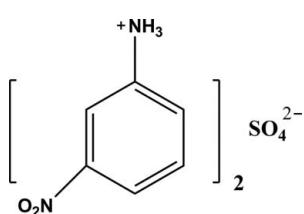

Received 14 February 2009; accepted 13 April 2009

Key indicators: single-crystal X-ray study; $T = 290\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.005\text{ \AA}$;
 R factor = 0.061; wR factor = 0.144; data-to-parameter ratio = 12.5.

In the title salt, $2\text{C}_6\text{H}_7\text{N}_2\text{O}_2^+\cdot\text{SO}_4^{2-}$, all the non-H atoms of both cations and the S atom and two O atoms of the anion lie on a crystallographic mirror plane. In the crystal structure, $\text{N}-\text{H}\cdots\text{O}$ and $\text{C}-\text{H}\cdots\text{O}$ hydrogen bonds help to establish the packing.

Bis(3-nitroanilinium) sulfate

Lingling Feng, Yubang Hou, Xuejian Yong and Feng Bao

S1. Comment

The Schiff base that is derived by condensing acetylacetone and a substituted aniline rearranges itself upon being deprotonated in order to chelate to copper (Barclay & Hoskins, 1965; Elmali *et al.*, 1997; Tahir *et al.*, 1996). In our hands, in the reaction of the 3-nitro substituted ligand with copper sulfate, the ligand is cleaved (probably to starting reactants). A analogous structure had been reported by our group (Bao *et al.*, 2006).

In the title compound, (I), the asymmetric unit consists of half sulfate anion and two halves of 3-nitroaniline cations (Fig. 1). H1B, H3B and O5 atoms were symmetry-related by a mirror and all the other atoms lie on the mirror. No other abnormal bond lengths and angles deserve discussion.

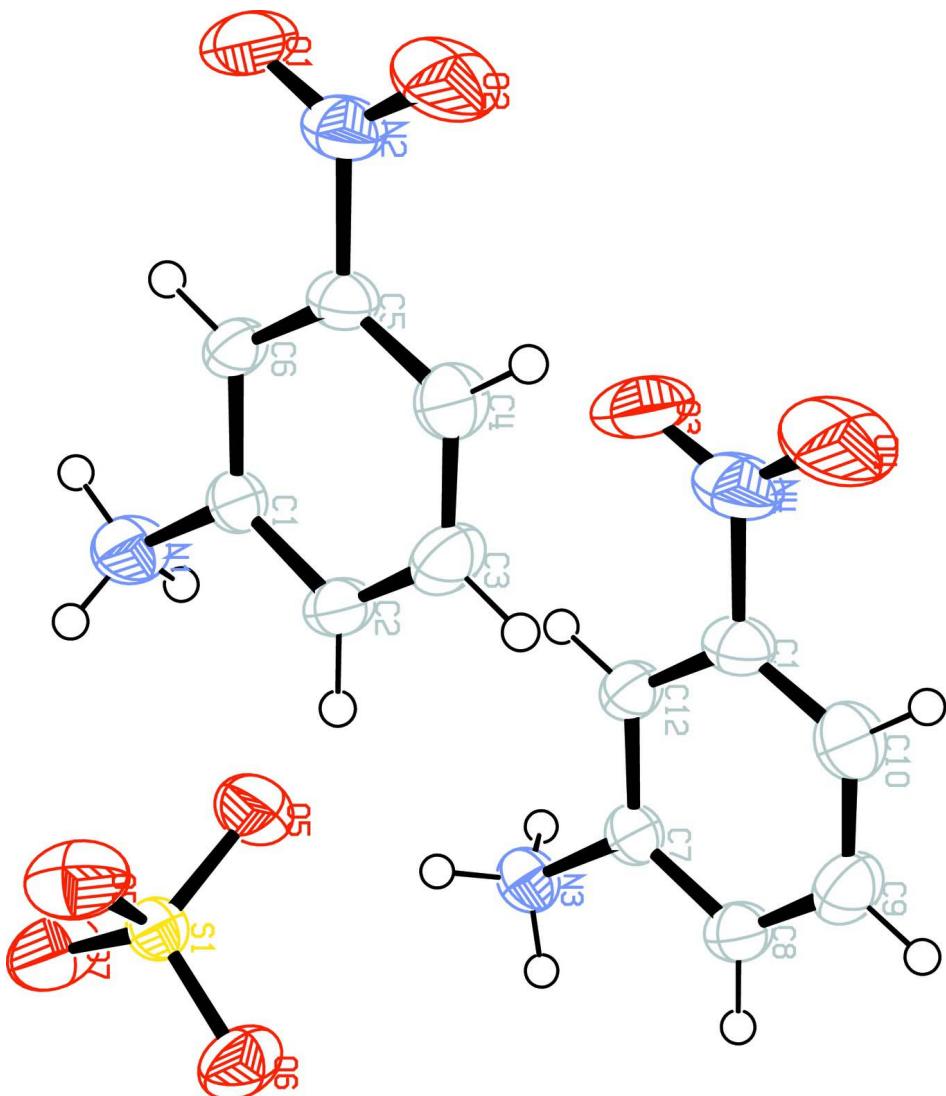

By a combination of N—H···O and C—H···O hydrogen bonds (Table 1), the ions in (I) are linked into a three-dimensional network. Except for above mentioned, no other interactions, such as π — π , C—H··· π etc., have been observed.

S2. Experimental

Acetylacetone (3 ml, 0.03 mol), 3-nitroaniline (4.14 g, 0.03 mol) and a catalytic amount of *p*-toluenesulfonic acid were dissolved in toluene (30 ml). The mixture was refluxed for 6 h and the water was separated azeotropically in a Dean–Stark apparatus. The solvent was removed and the product purified by recrystallization from hexane to yield 4-(3-nitrophenylamino)-3-penten-2-one in 80% yield. To a chloroform (5 ml) solution of the ligand (50 mg, 0.23 mmol) was added triethylamine (0.32 ml, 0.23 mmol) and copper sulfate (37 mg, 0.23 mmol) dissolved in ethanol (25 ml). The resulting brown mixture was filtered and the solution set aside for several days to allow for the formation of colourless blocks of (I); copper was not incorporated into the final product. CH&N elemental analysis calculated for C₁₂H₁₅N₄O₈S: C 38.40, H 4.03, N 14.39%; found: C 38.52, H 4.01, N 14.26%.

S3. Refinement

H atoms bonded to carbon atoms were placed in idealised positions with C—H = 0.93 Å and refined as riding with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$. Hydrogen atoms bonded to N1 and N3 were firstly found from the difference maps and refined with the constraint of N—H = 0.86 (2) Å and $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{N})$.

**Figure 1**

View of (I), with displacement ellipsoids drawn at the 50% probability level. H atoms are drawn as spheres of arbitrary radius and the hydrogen bond is indicated by a double-dashed line.

Bis(3-nitroanilinium) sulfate

Crystal data

$M_r = 374.33$

Orthorhombic, $Pbcm$

Hall symbol: -P 2c 2b

$a = 7.9177 (16)$ Å

$b = 30.843 (6)$ Å

$c = 6.3924 (13)$ Å

$V = 1561.1 (5)$ Å³

$Z = 4$

$F(000) = 776$

$D_x = 1.593$ Mg m⁻³

Mo $K\alpha$ radiation, $\lambda = 0.71073$ Å

Cell parameters from 6890 reflections

$\theta = 2.6\text{--}28.2^\circ$

$\mu = 0.26$ mm⁻¹

$T = 290$ K

Block, colorless

$0.12 \times 0.10 \times 0.08$ mm

Data collection

Bruker SMART CCD
diffractometer
Radiation source: fine-focus sealed tube
Graphite monochromator
 ω scans
Absorption correction: multi-scan
(SADABS; Sheldrick, 1997)
 $T_{\min} = 0.959$, $T_{\max} = 0.979$

12364 measured reflections
1845 independent reflections
1735 reflections with $I > 2\sigma(I)$
 $R_{\text{int}} = 0.027$
 $\theta_{\max} = 27.0^\circ$, $\theta_{\min} = 2.6^\circ$
 $h = -10 \rightarrow 10$
 $k = -39 \rightarrow 38$
 $l = -8 \rightarrow 8$

Refinement

Refinement on F^2
Least-squares matrix: full
 $R[F^2 > 2\sigma(F^2)] = 0.061$
 $wR(F^2) = 0.144$
 $S = 1.17$
1845 reflections
148 parameters
0 restraints
Primary atom site location: structure-invariant
direct methods

Secondary atom site location: difference Fourier
map
Hydrogen site location: inferred from
neighbouring sites
H-atom parameters constrained
 $w = 1/[\sigma^2(F_o^2) + (0.0402P)^2 + 2.0956P]$
where $P = (F_o^2 + 2F_c^2)/3$
 $(\Delta/\sigma)_{\max} < 0.001$
 $\Delta\rho_{\max} = 0.36 \text{ e } \text{\AA}^{-3}$
 $\Delta\rho_{\min} = -0.44 \text{ e } \text{\AA}^{-3}$

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
