Nanchong 637002, People's Republic of China  
Correspondence e-mail: qindabincwnu@yahoo.com.cn

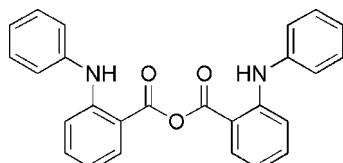

Received 16 March 2009; accepted 6 April 2009

Key indicators: single-crystal X-ray study;  $T = 93\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.002\text{ \AA}$ ;  $R$  factor = 0.039;  $wR$  factor = 0.111; data-to-parameter ratio = 15.7.

The complete molecule of the title compound,  $C_{26}\text{H}_{20}\text{N}_2\text{O}_3$ , is generated by crystallographic twofold symmetry, with the central O atom lying on the rotation axis. The conformation is stabilized by an intramolecular N—H···O hydrogen bond. The dihedral angle between the inner and outer aromatic ring planes is  $61.12(5)^\circ$ .

## N-Phenylanthranilic anhydride

Guan-Feng Liu, Yong-Wen Luo and Da-Bin Qin

### S1. Comment

*N*-Phenylanthranilic acid derivatives display a antipyretic acitivity, its RhI complex is known as a remarkably active hydrogenation catalyst. *N*-phenyl anthranilic acid anhydride, which is considered as an important reaction intermediate, We here report the crystal structure of the title compound, (I).

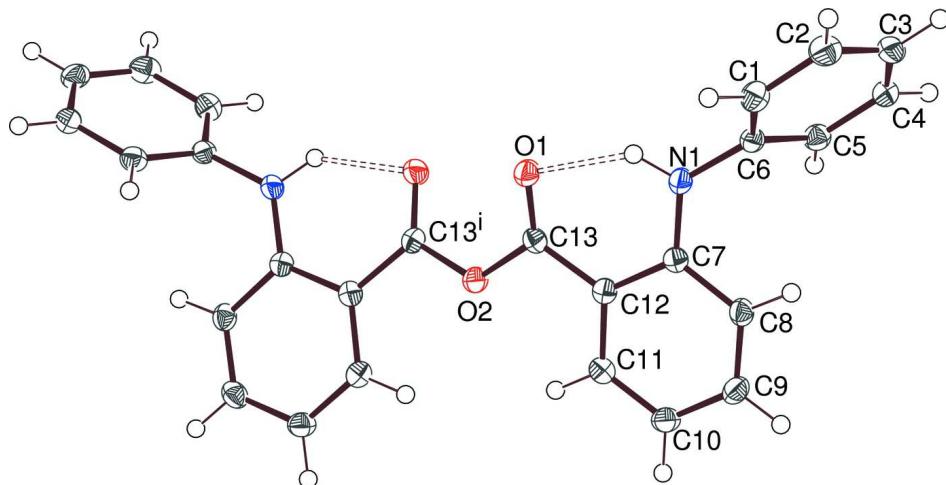

Bond lengths and angles in (I) (Fig. 1) are within their normal ranges. In each independent molecule, the arrangement of N—H···O hydrogen bond and the planar ( $O=C=O$ ) group is almost coplanar with respect to its carrier benzene ring, with dihedral angle of  $6.63(1)^\circ$ , but the two benzene rings in the diphenylamine units are twisted with a dihedral angle of  $61.12(4)^\circ$ . The structure is stabilized by an intramolecular hydrogen bond from an H atom of a amido N atom to a carbonyl O atom on the six-membered ring.

### S2. Experimental

The title compound was prepared according to the reported procedure of Martín *et al.* (2006) and Wiklund *et al.* (2004). Colourless chunks of (I) were obtained by recrystallization from ethyl acetate.

### S3. Refinement

The N-bound N atom was located in a difference map and its position and  $U_{\text{iso}}$  value were freely refined. The C-bound H atoms were placed in calculated positions with C—H = 0.95 Å and refined as riding with  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$ .

**Figure 1**

The molecular structure of (I) showing 50% probability displacement ellipsoids for the non-hydrogen atoms. Symmetry code: (i)  $-x, y, \frac{1}{2}-y$ .

 $\Delta\rho_{\text{min}} = -0.20 \text{ e } \text{\AA}^{-3}$

*Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
