Received 14 April 2009; accepted 18 April 2009

Key indicators: single-crystal X-ray study;  $T = 100\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.003\text{ \AA}$ ; disorder in main residue;  $R$  factor = 0.053;  $wR$  factor = 0.104; data-to-parameter ratio = 22.2.

The asymmetric unit of the title compound,  $\text{C}_{14}\text{H}_{13}\text{ClN}_2\text{O}_2\text{S} \cdot 0.15\text{H}_2\text{O}$ , a novel sulfonamide derivative, comprises two crystallographically independent molecules (*A* and *B*) and a water molecule of crystallization, which is partially occupied. One of the molecules (*B*) is disordered over two positions (*B* and *C*) with refined site occupancies of 0.605 (10) and 0.395 (10). The dihedral angles between the two benzene rings in molecules *A*, *B* and *C* are 67.8 (3), 74.6 (5) and 84.96 (11) $^\circ$ , respectively. In the crystal structure, intermolecular N—H···O and C—H···O hydrogen bonds link the components of the asymmetric unit. The crystal structure is further stabilized by intermolecular  $\pi$ – $\pi$  interactions [centroid–centroid distances = 3.4518 (10)–3.5859 (10)  $\text{\AA}$ ].

## (E)-N'-(4-Chlorobenzylidene)-*p*-toluenesulfonohydrazide 0.15-hydrate

Reza Kia, Hoong-Kun Fun and Hadi Kargar

### S1. Comment

Sulfonamides were the first class of antimicrobial agents to be discovered. They inhibit dihydropteroate synthetase in the bacterial folic acid pathway. Although their clinical role has diminished, they are still useful in certain situations because of its efficacy and low cost (Krygowski *et al.*, 1998). Sulfonamides (sulfanilamide, sulfamethoxazole, sulfafurazone) are structural analogues of *p*-aminobenzoic acid (PABA) and compete with PABA to block its conversion to dihydrofolic acid. These agents are generally used in combination with other drugs (usually sulfonamides) to prevent or treat a number of bacterial and parasitic infections (Tierney *et al.*, 2006). Because of the above important features, we report the crystal structure of the title compound (I).

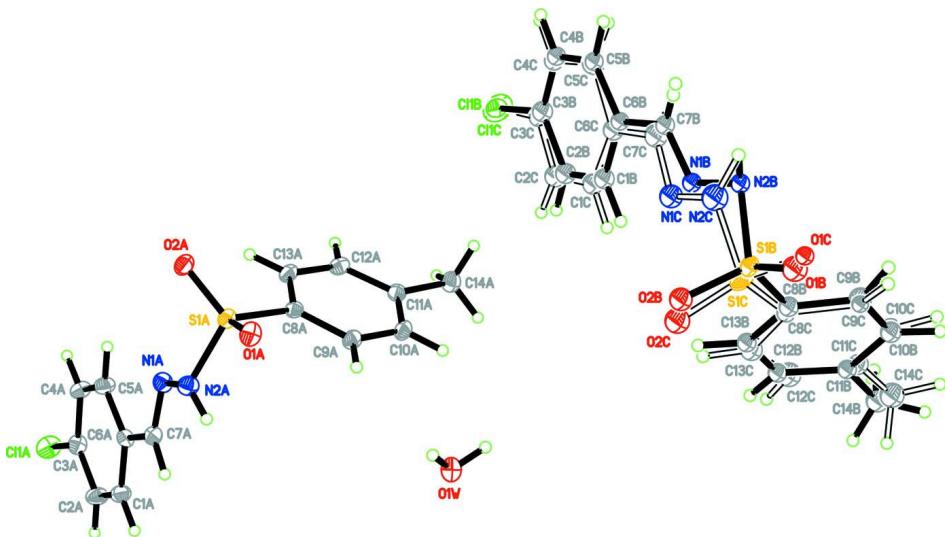

The title compound, (Fig. I), is a novel sulfonamide derivative. The bond lengths (Allen *et al.*, 1987) and angles are within the normal ranges and are comparable with the related structures (Kia *et al.* 2008a,b; Mehrabi *et al.*, 2008; Ali *et al.* 2007). The asymmetric unit of the title compound comprises two crystallographically independent molecules and a water molecule of crystallization which is partially occupied. One of the molecules of the title compound is disordered over two positions with a refined site-occupancy ratio of 0.605 (10)/0.395 (10). Intermolecular N—H···O and C—H···O hydrogen bonds link the neighbouring molecules together (Table 1). The dihedral angles between the two benzene rings in molecules A, B and C are 67.8 (3), 74.6 (5) and 84.96 (11)°, respectively. The crystal structure is further stabilized by intermolecular  $\pi$ – $\pi$  interactions [ $Cg1\cdots Cg2^{\text{iv}} = 3.749$  (3) Å, (iv)  $-1 + x, -1 + y, z$ ;  $Cg2\cdots Cg3^{\text{v}} = 3.805$  (5) Å, (v)  $1 + x, 1 + y, z$ ;  $Cg1, Cg2$  and  $Cg3$  are the centroids of the C1B–C6B, C1A–C6A, and C1C–C6C benzene rings].

### S2. Experimental

*p*-Tosylhydrazine (2 mmol) was added to a 50 ml refluxing ethanolic solution of 4-chlorobenzaldehyde (2 mmol). The mixture was stirred for 2 h. After cooling, the colorless crystalline solid was isolated by filtration, washed with cold ethanol, and re-crystallized from ethanol.

### S3. Refinement

The N-bound H atoms were located from the difference Fourier map and constrained to refine with the carrier atom with  $U_{\text{iso}}(\text{H}) = 1.2 U_{\text{eq}}(\text{N})$ . The rest of the hydrogen atoms were positioned geometrically and refined as riding model with  $U_{\text{iso}}(\text{H}) = 1.2$  or  $1.5 U_{\text{eq}}(\text{C})$ . A rotating group model was used for the methyl groups. For the disordered molecule, only the S and Cl atoms were refined anisotropically. Initially rigid, similarity and simulation restraints were applied. After steady state has been reached, these restraints were removed for the final refinement. There is no restraints used in the final refinement.

**Figure 1**

The molecular structure of the title compound, showing 50% probability displacement ellipsoids and the atomic numbering. Open bonds indicate the minor component.

#### Data collection

Bruker SMART APEXII CCD area-detector  
diffractometer

Radiation source: fine-focus sealed tube

Graphite monochromator

$\varphi$  and  $\omega$  scans

Absorption correction: multi-scan  
(*SADABS*; Bruker, 2005)

$$T_{\min} = 0.795, T_{\max} = 0.980$$

24411 measured reflections

8309 independent reflections

6194 reflections with  $I > 2\sigma I$

$$R_{\text{int}} = 0.037$$

$$\theta_{\max} = 30.0^\circ, \theta_{\min} = 2.0^\circ$$

$$h = -11 \rightarrow 11$$

$$k = -15 \rightarrow 15$$

$$l = -25 \rightarrow 24$$

#### Refinement

Refinement on  $F^2$

Least-squares matrix: full

$$R[F^2 > 2\sigma(F^2)] = 0.053$$

$$wR(F^2) = 0.104$$

$$S = 1.04$$

8309 reflections

375 parameters

0 restraints

Primary atom site location: structure-invariant  
direct methods

Secondary atom site location: difference Fourier  
map

Hydrogen site location: inferred from  
neighbouring sites

H-atom parameters constrained

$$w = 1/[\sigma^2(F_o^2) + (0.0215P)^2 + 1.6504P]$$

$$\text{where } P = (F_o^2 + 2F_c^2)/3$$

$$(\Delta/\sigma)_{\max} < 0.001$$

$$\Delta\rho_{\max} = 0.50 \text{ e \AA}^{-3}$$

$$\Delta\rho_{\min} = -0.50 \text{ e \AA}^{-3}$$

### Special details

**Experimental.** The crystal was placed in the cold stream of an Oxford Cyrosystems Cobra open-flow nitrogen cryostat (Cosier & Glazer, 1986) operating at 100.0 (1) K.

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
