Received 27 March 2009; accepted 30 March 2009

Key indicators: single-crystal X-ray study; $T = 299$ K; mean $\sigma(\text{C}-\text{C}) = 0.010$ Å; R factor = 0.094; wR factor = 0.103; data-to-parameter ratio = 14.6.

The N—H bond in the title compound, $\text{C}_8\text{H}_7\text{Cl}_2\text{NO}$, is *anti* to the *meta*-chloro substituent in the aromatic ring in both independent molecules comprising the asymmetric unit. The C=O bond is *anti* to the N—H bond and is also *anti* to the methylene H atoms. Intermolecular N—H...O hydrogen bonds link the molecules into supramolecular chains.

Related literature

2-Chloro-*N*-(3-chlorophenyl)acetamide

B. T. Gowda, S. Foro, H. Terao and H. Fuess

Comment

As part of a study of the effect of ring and side-chain substitutions on the solid-state geometry of aromatic amides (Gowda *et al.*, 2008a, b, c), in the present work the structure of 2-chloro-*N*-(3-chlorophenyl)acetamide (I) has been determined. The N—H bond is *anti* to the *meta*-chloro substituent in the aromatic ring (Fig. 1), similar to that observed in *N*-(3-chlorophenyl)acetamide (Gowda *et al.*, 2008a), but in contrast to the *syn* conformations observed with respect to the *meta*-methyl group in 2-chloro-*N*-(3-methylphenyl)acetamide (Gowda *et al.*, 2008c) and with respect to both chloro substituents in 2-chloro-*N*-(2,3-dichlorophenyl)acetamide (Gowda *et al.*, 2008b). Further, the C=O bond is not only *anti* to the N—H bond but also to the methylene-H-atoms. The asymmetric unit of the structure contains two molecules that are orthogonal to each other. The molecules in (I) are linked into infinite chains through intermolecular N1—H1···O2 and N2—H2···O1 hydrogen bonding (Table 1) as viewed down the *a*-axis (Fig. 2).

Experimental

Compound (I) was prepared according to the literature method (Gowda *et al.*, 2006). The purity of (I) was checked by determining its melting point and characterised by recording its infrared, NMR and NQR spectra (Gowda *et al.*, 2006 & Pies *et al.*, 1971). Single crystals of (I) were obtained from an ethanolic solution held at room temperature.

Refinement

The H atoms were positioned with idealised geometry using a riding model with C—H = 0.93–0.97 Å and N—H = 0.86 Å, and were refined with isotropic displacement parameters set to $1.2 \times U_{eq}(C)$.

Figures

Fig. 1. Molecular structure of (I), showing the atom labelling scheme. The displacement ellipsoids are drawn at the 50% probability level.

Fig. 2. Molecular packing of (I) viewed in projection down the *a*-axis, with N—H···O hydrogen bonding shown as dashed lines.

Crystal data

$C_8H_7Cl_2NO$	$F_{000} = 832$
$M_r = 204.05$	$D_x = 1.483 \text{ Mg m}^{-3}$
Orthorhombic, $P2_12_12_1$	Mo $K\alpha$ radiation
Hall symbol: P 2ac 2ab	$\lambda = 0.71073 \text{ \AA}$
$a = 4.897 (1) \text{ \AA}$	Cell parameters from 2170 reflections
$b = 17.379 (3) \text{ \AA}$	$\theta = 2.2\text{--}27.3^\circ$
$c = 21.484 (4) \text{ \AA}$	$\mu = 0.66 \text{ mm}^{-1}$
$V = 1828.4 (6) \text{ \AA}^3$	$T = 299 \text{ K}$
$Z = 8$	Needle, colourless
	$0.45 \times 0.08 \times 0.02 \text{ mm}$

Data collection

Oxford Diffraction Xcalibur diffractometer with a Sapphire CCD detector	3179 independent reflections
Radiation source: fine-focus sealed tube	1745 reflections with $I > 2\sigma(I)$
Monochromator: graphite	$R_{\text{int}} = 0.074$
$T = 299 \text{ K}$	$\theta_{\text{max}} = 25.3^\circ$
Rotation method data acquisition using ω and φ scans	$\theta_{\text{min}} = 2.2^\circ$
Absorption correction: multi-scan (CrysAlis RED; Oxford Diffraction, 2007)	$h = -5 \rightarrow 5$
$T_{\text{min}} = 0.756$, $T_{\text{max}} = 0.987$	$k = -20 \rightarrow 20$
10213 measured reflections	$l = -25 \rightarrow 23$

Refinement

Refinement on F^2	Hydrogen site location: inferred from neighbouring sites
Least-squares matrix: full	H-atom parameters constrained
$R[F^2 > 2\sigma(F^2)] = 0.094$	$w = 1/[\sigma^2(F_o^2) + (0.0084P)^2 + 1.6742P]$
$wR(F^2) = 0.103$	where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.23$	$(\Delta/\sigma)_{\text{max}} = 0.005$
3179 reflections	$\Delta\rho_{\text{max}} = 0.36 \text{ e \AA}^{-3}$
217 parameters	$\Delta\rho_{\text{min}} = -0.23 \text{ e \AA}^{-3}$
Primary atom site location: structure-invariant direct methods	Extinction correction: none
Secondary atom site location: difference Fourier map	Absolute structure: Flack (1983), 1206 Friedel pairs
	Flack parameter: 0.04 (13)

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations

between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
