Key indicators: single-crystal X-ray study; $T = 290$ K; mean $\sigma(\text{C}-\text{C}) = 0.003$ Å; R factor = 0.042; wR factor = 0.106; data-to-parameter ratio = 15.1.

In the title compound, $\text{C}_{17}\text{H}_{15}\text{Cl}_2\text{NO}$, the dimethylamino-phenyl group is close to coplanar with the central propenone group [dihedral angle = $13.1(1)^\circ$ between the mean planes], while the dichlorophenyl group is twisted from the plane [dihedral angle = $64.0(1)^\circ$]. In the crystal, $\text{C}-\text{H}\cdots\text{O}$ and weak $\text{C}-\text{H}\cdots\pi$ interactions are formed between molecules.

1-(2,4-Dichlorophenyl)-3-[4-(dimethylamino)phenyl]prop-2-enone

N. N. Bappalige, Brinda, Y. Narayana and V. Upadyaya

Experimental

A solution of potassium hydroxide (6.25 g, 0.11 mol) in ethanol (25 ml) was added slowly to a mixture of dichloroacetophenone (18.8 g, 0.01 mol) and *N*-dimethyl benzaldehyde (14.9 g, 0.01 mol) in a conical flask. After stirring for two hours, the precipitate was filtered and recrystallized from ethanol to give pale orange crystals.

Refinement

H atoms were positioned geometrically with C—H bond lengths of 0.93–0.96 Å and refined using a riding model with $U_{\text{iso}}(\text{H}) = 1.2$ or $1.5U_{\text{eq}}(\text{C})$.

Figures

Fig. 2. Packing diagram. The dotted lines indicate intermolecular C—H...O and C—H... π interactions.

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
