Received 9 April 2009; accepted 30 April 2009

Key indicators: single-crystal X-ray study; $T = 299$ K; mean $\sigma(\text{C}-\text{C}) = 0.006$ Å; R factor = 0.071; wR factor = 0.217; data-to-parameter ratio = 14.3.

In the title compound, $\text{C}_{13}\text{H}_{13}\text{NO}_2\text{S}$, the dihedral angle between the aromatic rings is $68.4(1)^\circ$. In the crystal, the molecules are linked into inversion dimers by pairs of $\text{N}-\text{H}\cdots\text{O}$ hydrogen bonds. The unit cell of this compound was reported previously [Oh *et al.* (1985). *Chung. Kwa. Yong. (Chung. J. Sci.)*, **12**, 67] but no atomic coordinates were established in the earlier study.

4-Methyl-*N*-phenylbenzenesulfonamide

B. T. Gowda, S. Foro, P. G. Nirmala, H. Terao and H. Fuess

Comment

As part of a study of the effect of substituent on the crystal structures of *N*-(aryl)-arylsulfonamides (Gowda *et al.*, 2009*a*, *b*, *c*), in the present work, the structure of 4-methyl-*N*-(phenyl)- benzenesulfonamide (I) has been determined. The conformations of the N—C bond in the C—SO₂—NH—C segment of the structure are "*trans*" and "*gauche*" with respect to the S=O bonds (Fig. 1). The molecule is bent at the S atom with the C—SO₂—NH—C torsion angle of -51.6 (3)°. The two benzene rings in (I) are tilted relative to each other by 68.4 (1)°. The other bond parameters in (I) are similar to those observed in 2,4-dimethyl-*N*-(phenyl)-benzenesulfonamide (Gowda *et al.*, 2009 *a*), 4-chloro-2-methyl-*N*-(phenyl)benzenesulfonamide (Gowda *et al.*, 2009 *b*), 4-methyl-*N*-(3,4-dimethylphenyl)- benzenesulfonamide (Gowda *et al.*, 2009 *c*) and other aryl sulfonamides (Perlovich *et al.*, 2006; Gelbrich *et al.*, 2007). The N—H···O hydrogen bonds (Table 1) pack the molecules into column like chains in the direction of *a*- axis (Fig. 2).

Experimental

The purity of the commercial sample was checked and characterized by recording its infrared and NMR spectra (Gowda *et al.*, 2005). The single crystals used in X-ray diffraction studies were grown in ethanolic solution by slow evaporation at room temperature.

Refinement

The N-bound H atom was located in difference map and its positional parameters were refined freely [N—H = 0.77 (4) Å]. The other H atoms were positioned with idealized geometry using a riding model [C—H = 0.93–0.96 Å] with $U_{\text{iso}}(\text{H}) = 1.2 U_{\text{eq}}(\text{N})$

Figures

Fig. 1. Molecular structure of (I), showing the atom labeling scheme and displacement ellipsoids drawn at the 50% probability level.

Fig. 2. Molecular packing of (I) with hydrogen bonding shown as dashed lines.

Refinement

Refinement on F^2

Least-squares matrix: full

$R[F^2 > 2\sigma(F^2)] = 0.071$

Hydrogen site location: inferred from neighbouring sites

H atoms treated by a mixture of independent and constrained refinement

$w = 1/[\sigma^2(F_o^2) + (0.1256P)^2 + 0.4489P]$

where $P = (F_o^2 + 2F_c^2)/3$

$wR(F^2) = 0.217$	$(\Delta/\sigma)_{\max} = 0.023$
$S = 1.10$	$\Delta\rho_{\max} = 0.47 \text{ e } \text{\AA}^{-3}$
2278 reflections	$\Delta\rho_{\min} = -0.50 \text{ e } \text{\AA}^{-3}$
159 parameters	Extinction correction: (SHELXL97; Sheldrick, 2008), $F_c^* = kFc[1+0.001xFc^2\lambda^3/\sin(2\theta)]^{-1/4}$
Primary atom site location: structure-invariant direct methods	Extinction coefficient: 0.060 (5)
Secondary atom site location: difference Fourier map	

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
