## **3-[(2-Hydroxyethyl)iminomethyl]-1,1'-bi-2-naphthol**

**Yu Zhang, Kun Wang, Ling-Zhi Zhong and Rui-Xiang Li**

### **S1. Comment**

BINOL and its derivatives have been largely used in asymmetric catalysis and chiral recognition (Pu, 1998). In this paper we present X-ray crystallographic analysis of the title compound (I), as the continuation of our previous studies.

As shown in Figure 1, an intramolecular O—H···N hydrogen bond between the hydroxy and the imino moieties forms a ring.

In the crystal, the molecules are connected by O—H···O hydrogen bonds (Fig. 2).

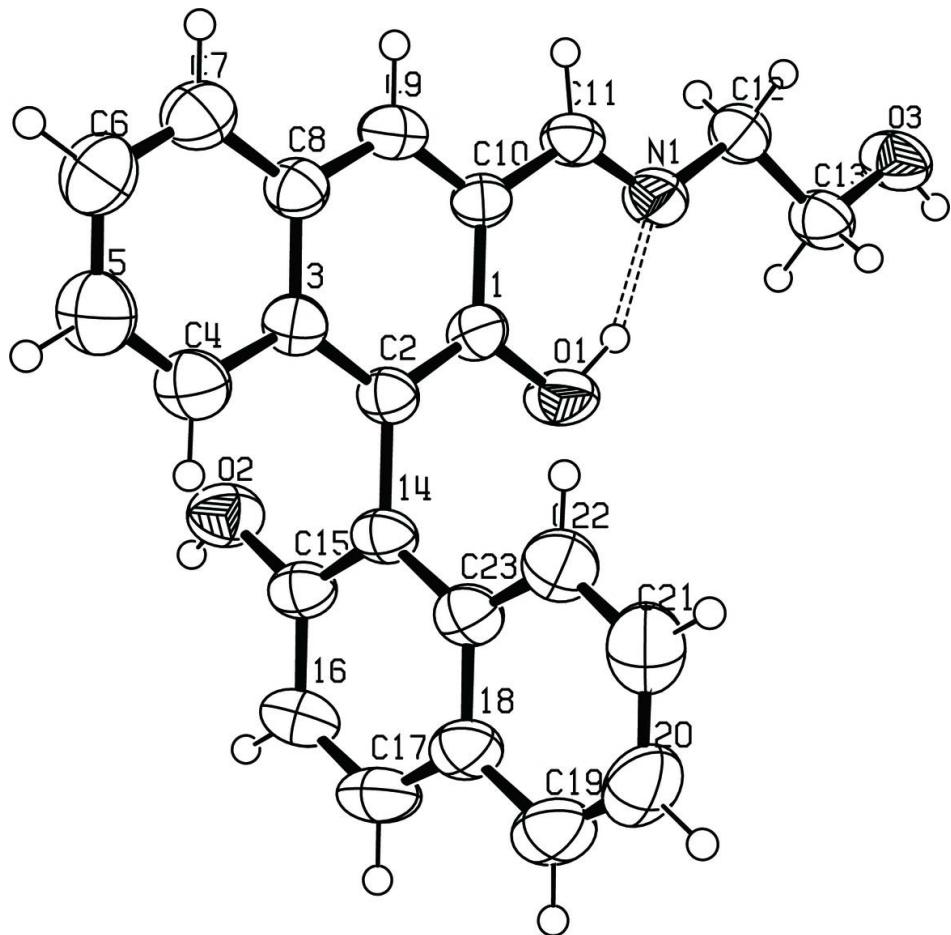

### **S2. Experimental**

The salen ligand,

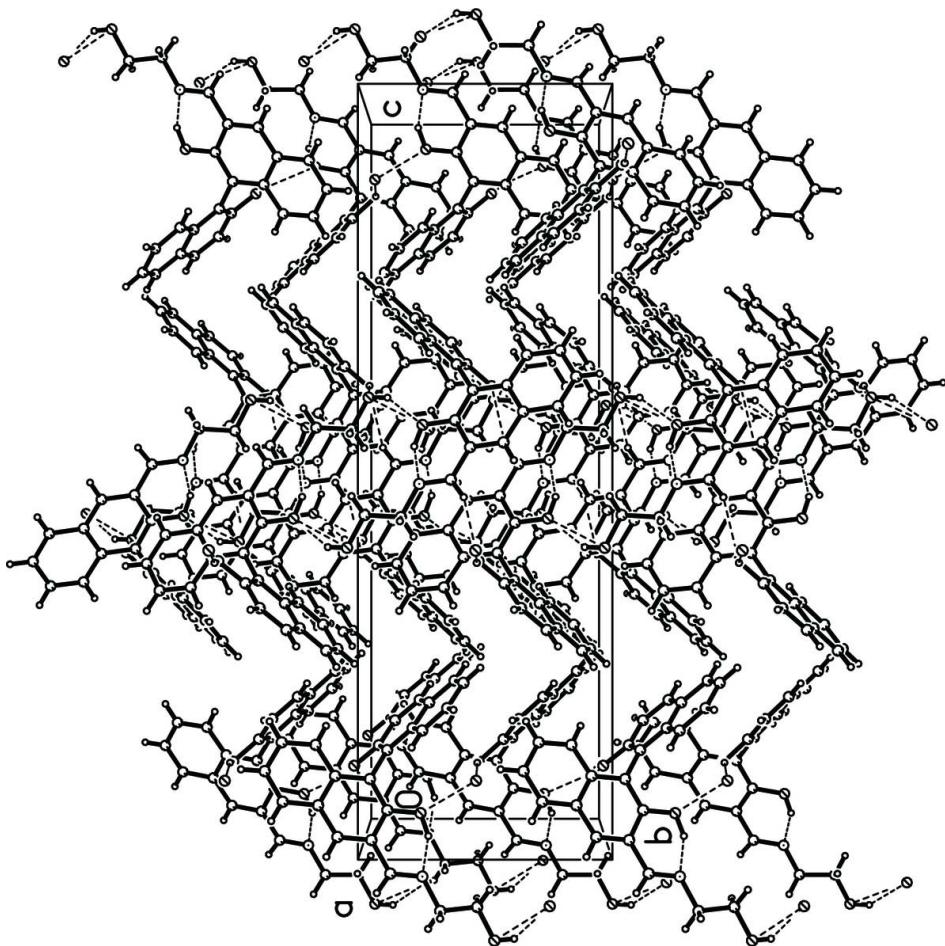

3-((2-hydroxyethylimino)methyl)-1,1'-binaphthol was prepared by condensation of 3-carboxaldehyde-1,1'-binaphthol with 2-aminoethanol. Crystals suitable for X-ray analysis were obtained by slow evaporation of a ethanol /methylene chloride (1:5) solution of the compound.

### **S3. Refinement**

All H atoms except the one bonded to O1 (which was freely refined) were placed in calculated positions and refined in the riding-model approximation with O—H = 0.82 Å and C—H = 0.93 or 0.97 Å) using a riding model with  $U_{\text{iso}}(\text{H}) = 1.2 U_{\text{eq}}(\text{C}, \text{O})$ .

### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^{\wedge}2^{\wedge}$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^{\wedge}2^{\wedge}$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^{\wedge}2^{\wedge}$ . The threshold expression of  $F^{\wedge}2^{\wedge} > \sigma(F^{\wedge}2^{\wedge})$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^{\wedge}2^{\wedge}$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
