Received 10 April 2009; accepted 15 May 2009

Key indicators: single-crystal X-ray study;  $T = 173\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.004\text{ \AA}$ ;  $R$  factor = 0.074;  $wR$  factor = 0.227; data-to-parameter ratio = 16.2.

In the crystal structure of the title compound,  $\text{C}_{20}\text{H}_{26}\text{O}_7$ , a lignin model compound, the asymmetric unit contains two molecules which adopt almost identical overall conformations with some deviation in the region of the terminal hydroxyl groups. The two molecules are linked by an intermolecular  $\text{O}-\text{H}\cdots\text{O}$  hydrogen bond. They also develop intramolecular  $\text{O}-\text{H}\cdots\text{O}$  hydrogen bonds.

## ***threo-2-(2,6-Dimethoxyphenoxy)-1-(4-ethoxy-3-methoxyphenyl)propane-1,3-diol***

**Kentaro Ishizuka, Daisuke Ando, Takashi Watanabe and Masaharu Nakamura**

### **S1. Comment**

Lignin is a complex biopolymer consisting of *p*-hydroxyphenyl, guaiacyl and syringyl phenylpropanoid monomer units. Aryl glycerol  $\beta$ -syringyl ethers are the main structural elements in hardwood lignins. The crystal structure of *threo*-2-(2,6-dimethoxyphenoxy)-1-(3,4-dimethoxyphenyl)-1,3-propanediol (Langer, Li *et al.*, 2002; Langer, Lundquist *et al.*, 2002) and several syringylglycerol  $\beta$ -syringyl ethers are reported. We have prepared a guaiacylglycerol  $\beta$ -syringyl ether type lignin model dimer having an ethyl ether substituent at 4-position, which does not show a similar packing structure or hydrogen bonding network to that of the methyl ether counterpart.

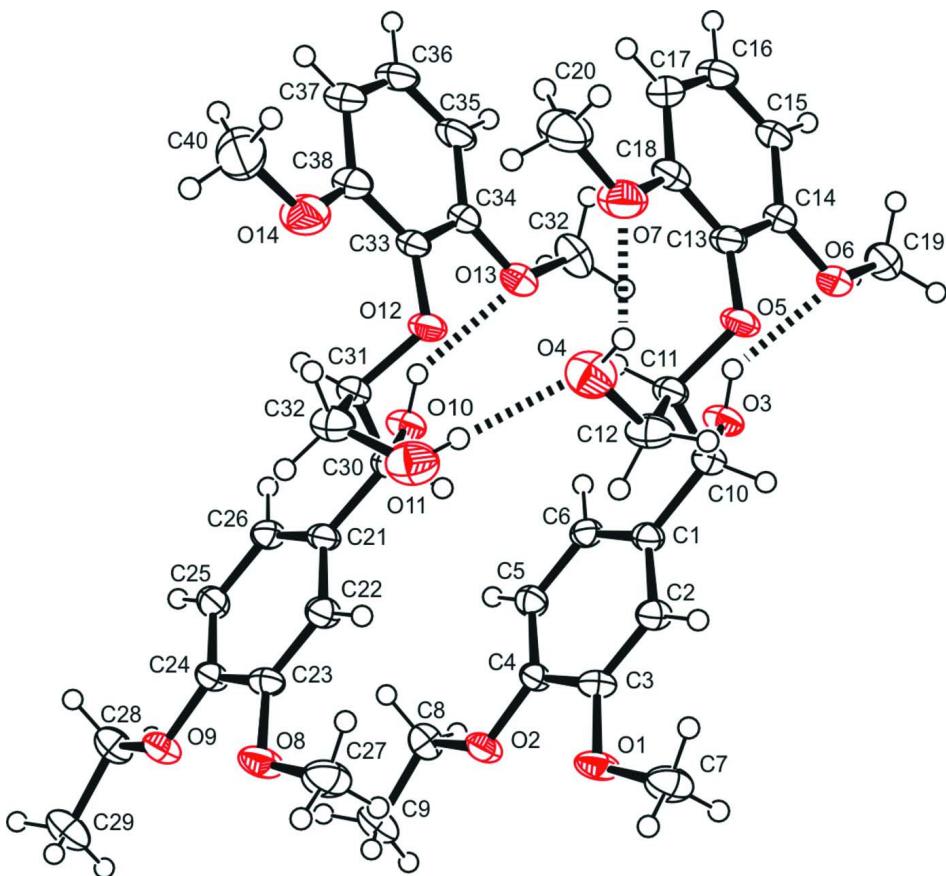

There are two molecules of the title compound in the asymmetric unit (Fig. 1). The conformations of two molecules are similar, as indicated by the torsion angles of 59.1 (3) and 61.3 (3) $^{\circ}$  along the phenylpropanoid skeleton (C1—C10—C11—C12 and C21—C30—C31—C32), respectively. They are connected with each other by the hydrogen bond of O11—H11 $\cdots$ O4 through the terminal hydroxyl groups. Intramolecular hydrogen bonds of O3—H3 $\cdots$ O6, O4—H4 $\cdots$ O7 and O10—H10 $\cdots$ O13 are also present (Table 1).

### **S2. Experimental**

The title compound was synthesized in two steps with a procedure similar to that reported in the literature (von Unge *et al.*, 1988). Separation of the *erythro* and *threo* forms of the first step product was accomplished by recrystallization from methanol to give *threo*-3-(4-ethoxy-3-methoxyphenyl)-2-(2,6-Dimethoxyphenoxy)-3-hydroxypropanoic acid **1**. The title compound, *threo*-1-(4-ethoxy-3-methoxyphenyl)-2-(2,6-dimethoxyphenoxy)-1,3-propanediol, was synthesized from **1**, and Single crystals of that suitable for X-ray crystallography were obtained from methanol.

### **S3. Refinement**

All H atoms were positioned geometrically and treated as riding, with C—H bond lengths constrained to 0.93 (aromatic), 0.96 (methyl), 0.97 (methylene), 0.98 (methine) and 0.82 Å (hydroxyl), and with  $U_{\text{iso}}(\text{H}) = xU_{\text{eq}}$  (carrier atom), where  $x = 1.5$  for methyl and hydroxyl groups and  $x = 1.2$  for other H atoms.

**Figure 1**

A view of the molecular structure of the title compound, which is an asymmetric unit with two molecules, with the atom-labeling scheme. Displacement ellipsoids are drawn at the 50% probability level. Dash lines indicate hydrogen bonds.

 $k = -35 \rightarrow 36$

$l = -18 \rightarrow 16$

#### Refinement

Refinement on  $F^2$   
 $R[F^2 > 2\sigma(F^2)] = 0.074$   
 $wR(F^2) = 0.227$   
 $S = 1.00$   
8726 reflections  
539 parameters

H-atom parameters constrained  
 $w = 1/[0.0018F_o^2 + \sigma(F_o^2)]/(4F_o^2)$   
 $(\Delta/\sigma)_{\text{max}} < 0.001$   
 $\Delta\rho_{\text{max}} = 0.59 \text{ e \AA}^{-3}$   
 $\Delta\rho_{\text{min}} = -0.67 \text{ e \AA}^{-3}$

#### Special details

**Refinement.** Refinement was performed using all reflections. The weighted  $R$ -factor ( $wR$ ) and goodness of fit ( $S$ ) are based on  $F^2$ .  $R$ -factor (gt) are based on  $F$ . The threshold expression of  $F^2 > 2.0 \sigma(F^2)$  is used only for calculating  $R$ -factor (gt).
