Received 28 April 2009; accepted 2 May 2009

Key indicators: single-crystal X-ray study;  $T = 298\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.003\text{ \AA}$ ;  $R$  factor = 0.054;  $wR$  factor = 0.173; data-to-parameter ratio = 13.2.

The title compound,  $C_{28}H_{28}N_2O_4$ , was synthesized by the reaction of 2-acetyl-1-naphthol with 1,4-bis(aminoxy)butane in ethanol. The molecule, which lies about an inversion centre, adopts a linear structure, in which the oxime groups and naphthalene ring systems assume an *anti* conformation. The intramolecular interplanar distance between parallel naphthalene rings is  $1.054(3)\text{ \AA}$ . Intramolecular O—H $\cdots$ N hydrogen bonds are formed between the oxime nitrogen and hydroxy groups.

## 2,2'-{1,1'-[Butane-1,4-diylbis(oxynitrilo)]diethylidyne}di-1-naphthol

Wen-Kui Dong, Jian-Chao Wu, Yin-Xia Sun, Jian Yao and Jun-Feng Tong

### S1. Comment

Salen-type compounds and their analogues are one of the most prevalent multidentate ligands in the field of modern coordination chemistry (Atwood & Harvey, 2001), which can coordinate to transition or rare earth ions yielding complexes with interesting properties that are useful in materials science and in biological systems (Okabe & Oya, 2000).

Herein, we report on the crystal structure of 2,2'-(butane-1,4-diyl)bis(nitriloethylidyne)dinaphthol, shown in Fig. 1. The structure of the title compound consists of discrete  $C_{28}H_{28}N_2O_4$  molecule, in which all bond lengths and angles are in normal ranges. The molecule is disposed about a crystallographic centre of symmetry with the  $(-\text{CH}=\text{N}—\text{O}(\text{CH})_4—\text{O}—\text{N}=\text{CH}-)$  bridge adopting a linear-shaped structure. The oxime groups and naphthalene rings assume an anti conformation. This structure is not similar to what was observed in our previously reported series salen-type compounds containing four-methene bridge, which often adopt an E configuration (Dong *et al.*, 2007, 2008).

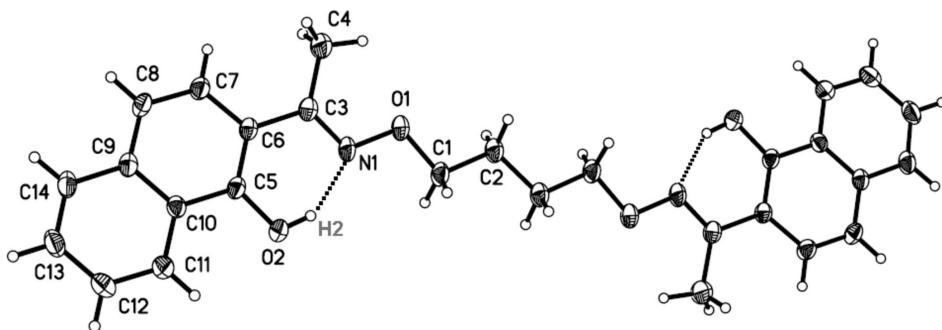

The two naphthalene rings in each molecule of the title compound are parallel and the distance between them is 1.054 (3) Å. Two intramolecular O—H···N hydrogen bonds are formed between the oxime nitrogen and hydroxy groups.

### S2. Experimental

2,2'-(Butane-1,4-diyl)bis(nitriloethylidyne)dinaphthol was synthesized according to our previous work (Dong *et al.*, 2007). To an ethanol solution (5 ml) of 2-acetyl-1-naphthol (760.0 mg, 2.02 mmol) was added dropwise an ethanol solution (3 ml) of 1,4-bis(aminooxy)butane (243.0 mg, 1.01 mmol). The mixture solution was stirred at 328–333 K for 75 h. After cooling to room temperature, the precipitate was filtered off, and washed successively three times with ethanol. The product was dried *in vacuo* and purified by recrystallization from ethanol to yield 618.6 mg (yield 67.0%) of powder. Single crystals were obtained by slow evaporation from a solution of ethanol/dichloromethane (1:2) of 2,2'-(butane-1,4-diyl)bis(nitriloethylidyne)dinaphthol at room temperature for several weeks. Anal. Calcd. for  $C_{28}H_{28}N_2O_4$ : C, 73.66; H, 6.18; N, 6.14; Found: C, 73.61; H, 6.23; N, 6.09%.

### S3. Refinement

Non-H atoms were refined anisotropically. H atoms were treated as riding atoms with distances C—H = 0.97 (CH<sub>2</sub>), C—H = 0.96 (CH<sub>3</sub>), 0.93 Å (CH), 0.82 Å (OH), and  $U_{\text{iso}}(\text{H}) = 1.2 U_{\text{eq}}(\text{C})$  and  $1.5 U_{\text{eq}}(\text{O})$ .

**Figure 1**

The molecule structure of the title compound with atom numbering [Symmetry codes:  $-x + 1, -y + 1, -z$ ]. Displacement ellipsoids for non-hydrogen atoms are drawn at the 30% probability level.

 $(\Delta/\sigma)_{\max} < 0.001$   
 $\Delta\rho_{\max} = 0.23$  e Å<sup>-3</sup>  
 $\Delta\rho_{\min} = -0.25$  e Å<sup>-3</sup>

*Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
