Received 7 May 2009; accepted 11 May 2009

Key indicators: single-crystal X-ray study;  $T = 100$  K; mean  $\sigma(C-C) = 0.003$  Å;  $R$  factor = 0.070;  $wR$  factor = 0.190; data-to-parameter ratio = 22.6.

In the title compound,  $C_{21}H_{24}O_3$ , the conformation of the enone group is *s-cis*. The benzene rings are inclined at an angle of  $7.9(1)^\circ$ . The alkoxy tail is planar, with a maximum deviation from the least-squares plane of  $0.009(2)$  Å, and adopts a *trans* conformation throughout. An intramolecular O—H···O interaction between the keto and hydroxy groups forms *S(6)* ring motifs. In the crystal, molecules are arranged in a head-to-tail manner down the *a* axis and are subsequently stacked along the *b* axis, forming molecular sheets parallel to the *ab* plane. The crystal structure is further stabilized by weak C—H···π interactions and short C···O [3.376(2) Å] contacts.

### S1. Comment

The biological properties of chalcones derivatives, such as their anticancer (Bhat *et al.*, 2005), antimalarial (Xue *et al.*, 2004), antiangiogenic and antitumour (Lee *et al.*, 2006) and antiplatelet (Zhao *et al.*, 2005) activities, have been extensively reported. Synthetic and naturally occurring chalcones are of interest and have been widely studied and developed as one of the pharmaceutically important molecules. As part of our studies, we have synthesized the title chalcone derivative, (I). Its antibacterial activity was tested against *E. coli* ATCC 8739 and the compound demonstrated antimicrobial activity. In this paper, we report the crystal structure of the title compound.

The bond lengths observed in the title compound (Fig. 1) are comparable with those reported by Allen *et al.* (1987). The enone (O2/C7—C9) moiety adopts *s-cis* conformation with a O2—C7—C8—C9 torsion angle of -3.6 (3)°. The mean plane through the enone moiety makes dihedral angles of 0.89 (1)° and 7.9 (1)° with the C1—C6 and C10—C15 benzene rings, respectively. The dihedral angle between the two benzene rings is 7.9 (1)°.

The slight opening of the C1—C6—C7 (123.4 (2)°) and C6—C7—C8 (121.1 (2)°) angles is the result of the short H1A···H8A (2.15 Å) contact whereas close interatomic contact between H8A and H15A (2.36 Å) widened the C8—C9—C10 and C9—C10—C15 angles to 129.2 (2)° and 124.1 (2)°, respectively. Likewise, strain induced by short H12A···H16A (2.39 Å) and H12A···H16B (2.33 Å) contacts resulted in the opening of the O3—C13—C12 (125.1 (2)°) angle. Similar features were also reported in related structures (Razak, Fun, Ngaini, Rahman *et al.*, 2009; Razak, Fun, Ngaini, Fadzillah & Hussain, 2009a,b; Ngaini, Fadzillah *et al.*, 2009; Ngaini, Rahman *et al.*, 2009).

The zigzag alkoxy tail adopts an all-*trans* conformation with the largest deviation from the ideal value being -179.3 (2)° for C17—C18—C19—C20 torsion angle. The alkoxy chain is planar with the maximum deviation from the least-squares plane of 0.009 (2) Å at C18. The zigzag plane makes a dihedral angle of 2.2 (1)° with the attached benzene ring.

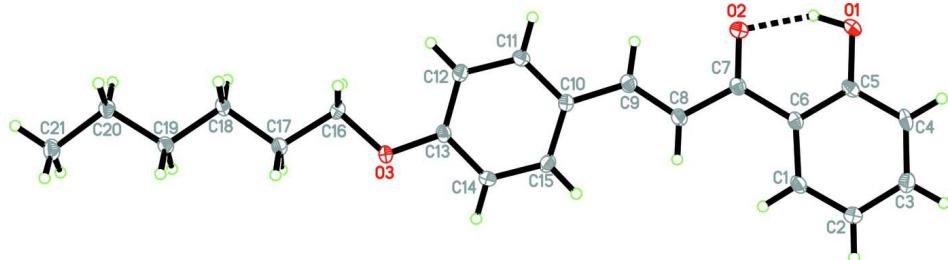

The keto and hydroxy groups in the molecule form an intramolecular O1—H1O1···O2 interaction (Table 1) generating a ring of graph-set motif *S*(6) (Bernstein *et al.*, 1995). In the crystal structure, the molecules are arranged into a head-to-tail manner down the *a* axis (Fig. 2). Molecules are subsequently stacked along the *b* axis, forming molecular sheets parallel to the *ab* plane. In the absence of conventional hydrogen bonds, the crystal packing is strengthened by the presence of weak C—H···π interactions between atom C20 of the alkoxy tail and the C1—C6 benzene ring (Table 1). There is also a short C···O (*x*, 1.5-*y*, 0.5+*z*) [3.376 (2) Å] contact.

### S2. Experimental

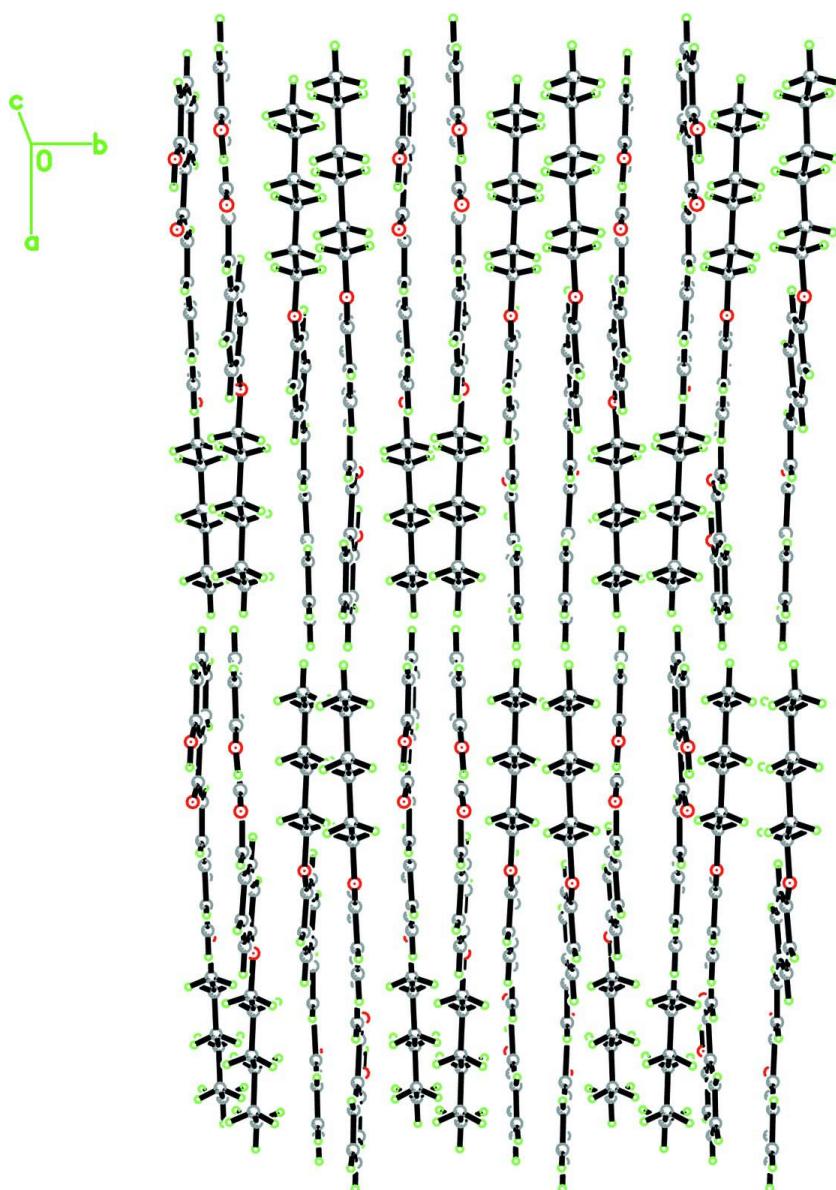

A mixture of 2-hydroxyacetophenone (2.72 ml, 20 mmol) and 4-hexyloxybenzaldehyde (4.12 ml, 20 mmol) and KOH (4.04 g, 72 mmol) in 60 ml of methanol was heated at reflux for 24 h. The reaction was cooled to room temperature and acidified with cold diluted HCl (2 M). The resulting precipitate was filtered, washed and dried. After redissolving in hexane, followed by few days of slow evaporation, crystals were collected.

**S3. Refinement**

The O-bound H atom was located in a difference Fourier map and refined freely. All the C-bound H atoms were positioned geometrically and refined using a riding model with C—H = 0.93–0.97 Å. The  $U_{\text{iso}}$  values were constrained to be -1.5 $U_{\text{equ}}$  (methyl H atoms) and -1.2 $U_{\text{equ}}$  (other H atoms). The rotating model group was applied for the methyl group.

**Figure 1**

The molecular structure of the title compound, showing 50% probability displacement ellipsoids and the atom numbering scheme. The intramolecular interaction is shown as dashed line.

**Figure 2**

The crystal packing of the title compound, viewed down the *c* axis.

*Special details*

**Experimental.** The crystal was placed in the cold stream of an Oxford Cryosystems Cobra open-flow nitrogen cryostat (Cosier & Glazer, 1986) operating at 100.0 (1) K.

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
