Received 6 June 2009; accepted 21 June 2009

Key indicators: single-crystal X-ray study; $T = 294\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.002\text{ \AA}$; R factor = 0.037; wR factor = 0.100; data-to-parameter ratio = 12.7.

The crystal structure of the title compound, $2\text{C}_5\text{H}_6\text{NO}_2^+ \cdot \text{C}_4\text{H}_2\text{O}_4^{2-}$, consists of 3-hydroxypyridinium cations and fumarate dianions. The dianion is located on an inversion center and the cation is linked to it by $\text{O}-\text{H}\cdots\text{O}$ and $\text{N}-\text{H}\cdots\text{O}$ hydrogen bonds. The cation is twisted with respect to the anion by $24.83(5)^\circ$.

Bis(3-hydroxypyridinium) fumarate

Lan Shen, Jun-Hua Li, Jing-Jing Nie and Duan-Jun Xu

S1. Comment

The hydroxypyridine derivatives and the fumaric acid have been extensively applied in biological and medicine fields (Zhang *et al.*, 2004; Thomas *et al.*, 2007; Fidler *et al.*, 2003). Although the carboxyl group of the fumaric acid is usually deprotonated while the pyridine derivatives are protonated in the solution (Lezina *et al.*, 1981), some crystal structures showed that they also exist as co-crystal of neutral molecules (Bowes *et al.* 2003; Aakeroy *et al.*, 2002; Haynes *et al.* 2006; Xu *et al.* 2009). Herein we report the crystal structure of the title compound containing pyridine derivative and fumaric acid components.

The crystal structure of the title compound consists of fumarate anions and 3-hydroxypyridinium cations (Fig. 1). The planar fumarate anion is located in an inversion center. The C1—O1 bond distance of 1.2603 (15) Å is similar to C1—O2 bond distance of 1.2452 (15) Å, it agrees with those found in metal complexes of fumarate (Liu *et al.* 2003; Liu & Xu, 2004).

The 3-hydroxypyridine is protonated in the crystal structure, the geometry data is consistent with those in crystal structures of 3-hydroxypyridinium hydrogen *L*-malate (Aakeroy & Nieuwenhuyzen, 1994) and 3-hydroxypyridinium hydrogen tartronate (Fukunaga *et al.* 2004).

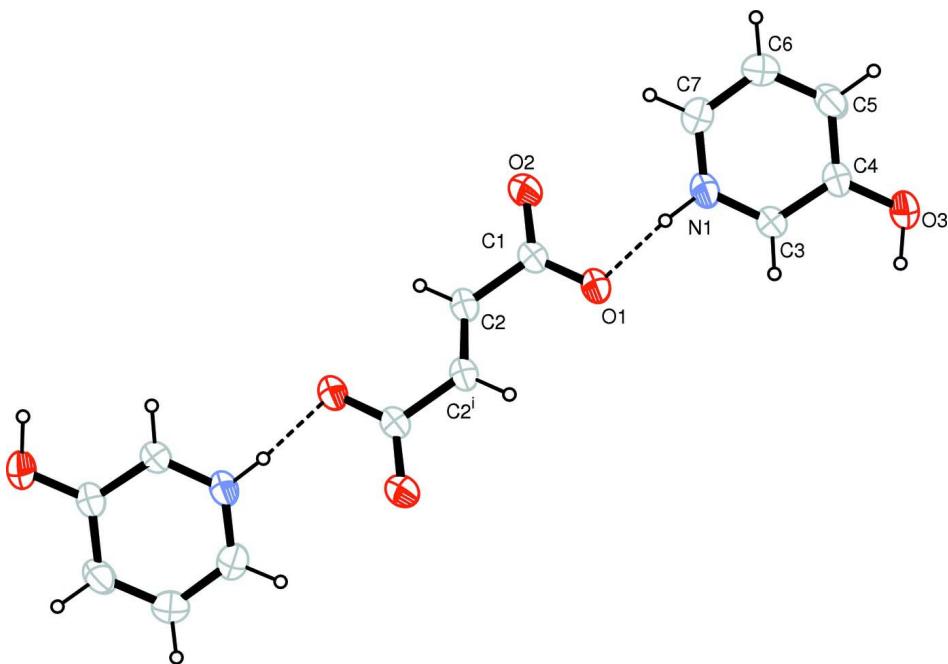

In the crystal structure the planar hydroxypyridinium cation is twisted respect to the planar fumarate with a dihedral angle of 24.83 (5)°, and links with the fumarate anions *via* N—H···O and O—H···O hydrogen bonding (Table 1 and Fig. 2).

S2. Experimental

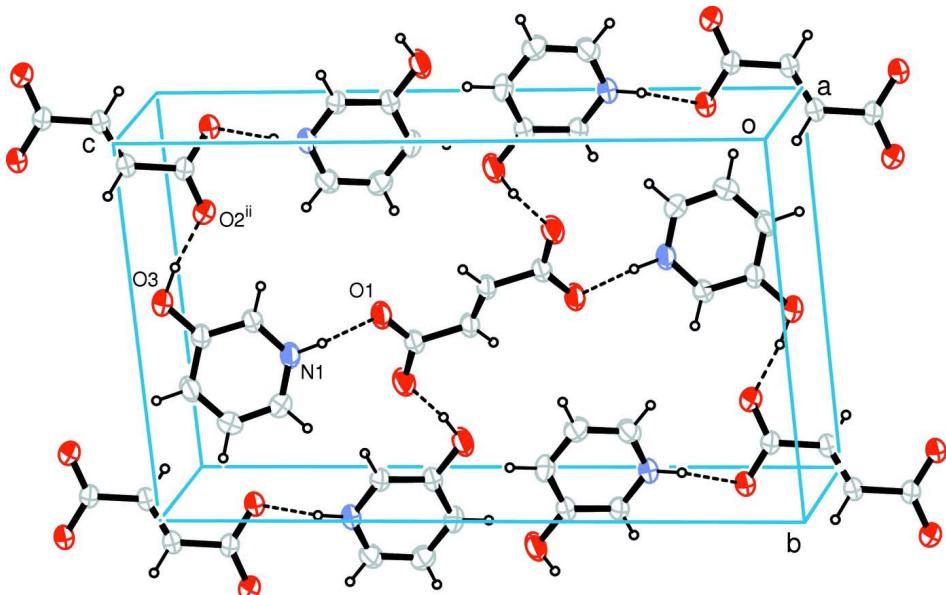

Reagents and solvent were used as purchased without further purification. 3-Hydroxypyridine (2 mmol) and fumaric acid (1 mmol) were dissolved in ethanol (5 ml) at room temperature. The single crystals were obtained from the solution after one week.

S3. Refinement

H atoms bonded to N and O atoms were located in a difference Fourier map and were refined with distance restraints of O—H = 0.82±0.01 and N—H = 0.86±0.01 Å; $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{N}, \text{O})$. Other H atoms were placed in calculated positions with C—H = 0.93 Å and refined in riding mode with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$.

**Figure 1**

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
