Received 8 July 2009; accepted 23 July 2009

Key indicators: single-crystal X-ray study; $T = 298\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.006\text{ \AA}$;
 R factor = 0.052; wR factor = 0.260; data-to-parameter ratio = 14.6.

The salen-type bis-oxime title compound, $C_{26}H_{36}N_2O_4$, lies about a crystallographic inversion centre. Classical intramolecular O—H···N hydrogen bonds generate two S(6) ring motifs. In the crystal structure, pairs of weak intermolecular C—H···O hydrogen bonds link adjacent molecules into an infinite one-dimensional supramolecular structure.

2,2'-[1,1'-(Decane-1,10-diyldioxydinitrilo)diethylidyne]diphenol

Xiao-Qiang Wang, Jun-Feng Tong, Wen-Kui Dong, Shang-Sheng Gong and Jian-Chao Wu

S1. Comment

Schiff bases are one of most prevalent mixed-donor ligands in the field of coordination chemistry and have been intensively studied due to their strong coordination capability as well as their diverse biological activities, such as antibacterial, antitumor, *etc.* (Koizumi *et al.*, 2005; Boskovic *et al.*, 2003; Oshio *et al.*, 2005). In addition, many Schiff base derivatives have been synthesized and employed to develop protein and enzyme mimics (Santos *et al.*, 2001). Our group is interested in the synthesis and structure of salen-type bisoxime compounds by Schiff base reaction (Dong *et al.*, 2008a; Dong *et al.*, 2008b). Here, we report, for the first time, the synthesis and crystal structure of a salen-type bisoxime compound containing ten-methene bridge, 2,2'-[1,1'-(decane-1,10-diyldioxydinitrilo)diethylidyne]diphenol.

Perspective view of the title molecule, showing the atomic numbering scheme, is given in Fig. 1. Each molecule exists in a *trans* configuration with respect to the methylidene unit. The two phenyl rings in each molecule are parallel to each other, with C1—O1—N1—C7 torsion angles of 178.7 (3) $^{\circ}$ and a perpendicular interplanar spacing of *ca* 6.695 (2) Å. In each title compound, there exist two classical intramolecular O—H \cdots N hydrogen bonds (Fig. 1) which generate two six-membered rings, producing two S(6) ring motifs. In the crystal structure, pairs of weak intermolecular C—H \cdots O hydrogen bonds (Table 1, Fig. 2)(Desiraju, 1996) link the adjacent molecules into an infinite one-dimensional supramolecular structure (Fig. 2).

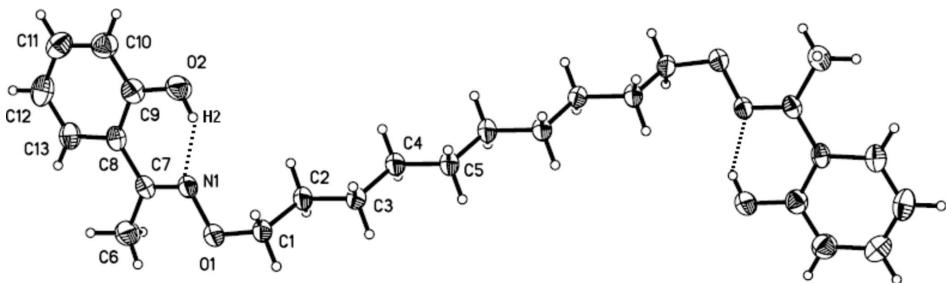

S2. Experimental

2,2'-[1,1'-(Decane-1,10-diyldioxydinitrilo)diethylidyne]diphenol was synthesized according to the literature (Dong, *et al.*, 2009). To an absolute ethanol solution (4 ml) of 2'-hydroxyacetophenone (375.8 mg, 2.76 mmol) was added an absolute ethanol solution (4 ml) of 1, 10-bis(aminoxy)decane (180.9 mg, 1.38 mmol). The mixture solution was stirred at 328–333 K for 48 h. When cool to room temperature (298 K), white precipitate was formed which was filtered and washed successively with absolute ethanol (2 ml) and n-hexane (8 ml), respectively. The product was dried under vacuum and purified by recrystallization from ethanol to yield 331.9 mg of the title compound. Yield, 52.75%. m. p. 343–344 K. Anal. Calcd. for C₂₆H₃₆N₂O₄: C, 70.88; H, 8.24; N, 6.36. Found: C, 70.59; H, 8.23; N, 6.57.

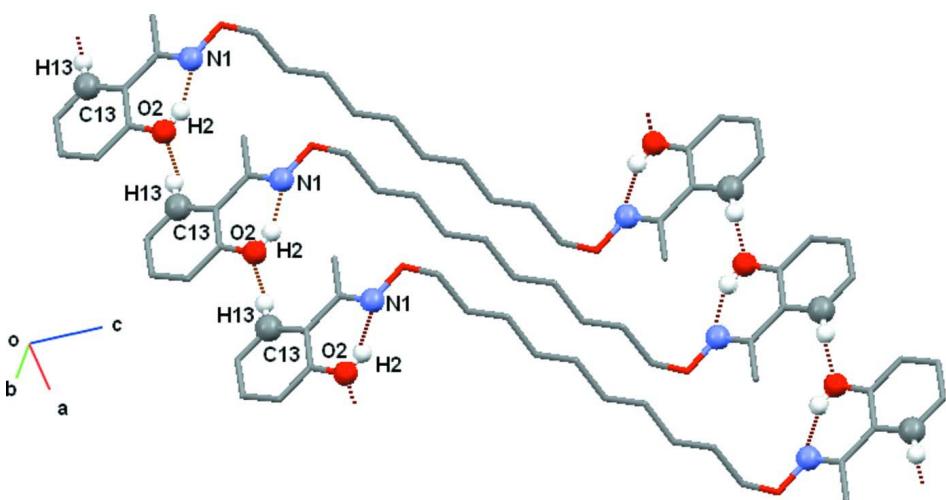

Colorless block-like single crystals suitable for X-ray diffraction studies were obtained after several days by slow evaporation from a diethyl ether solution of the title compound.

S3. Refinement

Non-H atoms were refined anisotropically. H atoms were treated as riding atoms with distances C—H = 0.96 Å (CH₃), 0.97 Å (CH₂), 0.93 Å (CH), 0.82 Å (OH), and $U_{\text{iso}}(\text{H}) = 1.20 U_{\text{eq}}(\text{C})$ for methylene and methylidyne, 1.50 $U_{\text{eq}}(\text{C})$ for methyl, 1.50 $U_{\text{eq}}(\text{O})$. The crystal quality was not good enough to provide data completeness to 1.0, which is also reflected in the weighted R .

**Figure 1**

The molecular structure of the title compound with atom numbering scheme [Symmetry codes: $-x + 1/2, -y + 3/2, -z + 1$]. Displacement ellipsoids for non-hydrogen atoms are drawn at the 30% probability level.

**Figure 2**

Part of the one-dimensional supramolecular structure of the title compound. Intramolecular and intermolecular hydrogen bonds of the title compound are shown as dashed lines.

 $wR(F^2) = 0.260$
 $S = 1.03$
 2124 reflections
 145 parameters
 0 restraints
 Primary atom site location: structure-invariant direct methods

Secondary atom site location: difference Fourier map
 Hydrogen site location: inferred from neighbouring sites
 H-atom parameters constrained
 $w = 1/[c^2(F_o^2) + (0.1008P)^2 + 5.3906P]$
 where $P = (F_o^2 + 2F_c^2)/3$
 $(\Delta/\sigma)_{\max} < 0.001$
 $\Delta\rho_{\max} = 0.21 \text{ e } \text{\AA}^{-3}$
 $\Delta\rho_{\min} = -0.23 \text{ e } \text{\AA}^{-3}$

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
