Received 30 March 2009; accepted 13 July 2009

Key indicators: single-crystal X-ray study; $T = 110$ K; mean $\sigma(C-C) = 0.002$ Å; R factor = 0.036; wR factor = 0.099; data-to-parameter ratio = 24.0.

In the title compound, $C_{13}H_9ClN_2O_3$, an intramolecular hydrogen bond between the carbonyl O and an amine H atom from the 2-aminobenzoyl group stabilizes the molecule, keeping these two groups nearly in the same plane [dihedral angle 14.6 (6)°]. The dihedral angle between the mean planes of the planar 2-aminobenzoyl and 2-chlorobenzoyl groups is 73.8 (6)°. The crystal packing is stabilized by a collection of intermediate hydrogen-bonding interactions which forms an infinite $N-H\cdots O\cdots H-N-H\cdots O$ hydrogen-bonded chain along the c axis in concert with weak $N-H\cdots Cl$ interactions in the same direction, producing a two-dimensional intermolecular bonding network parallel to (001). Additional weak $C-Cl\cdots Cg$ [$Cl\cdots Cg = 3.858$ (3) Å] and $N-O\cdots Cg$ [$O\cdots Cg = 3.574$ (1) and 3.868 (6) Å] π -ring interactions provide added support to the crystal stability. A MOPAC computational calculation gives support to these observations.

2-Amino-5-nitrophenyl 2-chlorophenyl ketone

Jerry P. Jasinski, Ray J. Butcher, Q. N. M. Hakim Al-Arique, H. S. Yathirajan and A. R. Ramesha

S1. Comment

Benzophenone derivatives are widely used in sunscreen lotions for UVA protection (Deleu *et al.*, 1992). Benzophenone and related analogues have been reported to act as antiallergic, anti-inflammatory, antiasthmatic, antimarial, antimicrobial and antianaphylactic agents (Evans *et al.*, 1987; Wiesner *et al.*, 2002; Sieroń *et al.*, 2004). The competence of benzophenones as chemotherapeutic agents, especially as inhibitors of HIV-1 reverse transcriptase RT, cancer and inflammation, is well established and their chemistry has been studied extensively (Revesz *et al.*, 2004). Phenylmethanones are a class of compounds having many pharmacological properties. 4-Aminobenzophenones have high anti-inflammatory activity (Ottosen *et al.*, 2003), a benzophenyl cyano derivative acts as a vasorelaxant (Duncan *et al.*, 2004) and the piperidinyl derivative produces analgesia (Colpaert *et al.*, 2004). The crystal structures of some related compounds, viz., N-(2-benzoyl-4-chlorophenyl)-2-chloroacetamide (Malathy Sony *et al.*, 2005), 2-chloroacetamido-5-chlorobenzophenone and 2-chloroacetamido-5-chloro-2'-fluorobenzophenone (Prasanna & Guru Row, 2000), 2-methyl-amino-5-chlorobenzophenone (Cox *et al.*, 1997), 2-amino-2'-chloro-5-methylbenzophenone (Xing *et al.*, 2005) and 3-chloro-4-hydroxy-4'-methylbenzophenone (Harrison *et al.*, 2005) have been reported. Over 450 crystal structures of benzophenone derivatives in the Cambridge Structural Database (CSD, Version 5.26; Allen, 2002) highlight the importance of structural studies on such pharmaceutically useful compounds. The title compound, $C_{13}H_9ClN_2O_3$, is an intermediate in the synthesis of certain anxiolytic, anticonvulsant and sedative drugs. The title compound is also a starting material for the synthesis of diazepam and other benzodiazepines. In view of the importance of the title compound, the present paper describes its crystal structure.

The title compound, $C_{13}H_9ClN_2O_3$, crystallizes with one molecule in the asymmetric unit with $Z = 4$. An intramolecular hydrogen bond between the carbonyl oxygen (O_3) and an amine hydrogen atom ($H1B$) from the 2-amino-5-nitrobenzoyl group keeps these two groups nearly in the same plane relative to each other (Fig. 1). The dihedral angle between the mean planes of the carbonyl group ($-C_6-C_7(O_3)-C_8-$) and the mean planes of the 2-amino and 2'-chlorobenzoyl planar groups is $14.6(6)^\circ$ and $66.2(9)^\circ$, respectively. The $C_5-C_6-C_7-O_3$ torsion angle ($164.45(11)^\circ$) supports this observation. The nitro group is twisted slightly away from the plane of the 2-amino-benzyl group ($O_2-N_2-C_4-C_3$ torsion angle = $178.46(11)^\circ$). The dihedral angle between the mean planes of the 2-aminobenzyl and 2'-chlorobenzyl planar groups is $73.8(6)^\circ$. This value lies between the large twist angle of $83.72(6)^\circ$ as seen in 2-amino and 2'-chlorobenzophenone, $C_{13}H_9ClNO$, (Cox *et al.*, 2008) and $64.66(8)^\circ$ observed in 4-chloro-4'-hydroxybenzophenone, $C_{13}H_9ClO_2$ (Cox *et al.*, 2008). Crystal packing is supported by a collection of intermediate $N1-H1A\cdots O_3$, $N1-H1B\cdots O_3$, $C13-H13A\cdots O_2$ hydrogen bonds and weak $N1-H1B\cdots Cl$ intermolecular interactions (see Table 1) which produces an infinite, two-dimensional $N-H\cdots O\cdots H-N-H\cdots O$ bonding network parallel to the (001) plane of the unit cell (Fig. 2). Additional weak $C9-Cl\cdots Cg(2)$ [$Cl\cdots Cg(2) = 3.858(3)\text{\AA}$], $N2-O1\cdots Cg(2)$ [$O1\cdots Cg(2) = 3.574(1)\text{\AA}$] and $N2-O2\cdots Cg(1)$ [$O2\cdots Cg(1) = 3.868(6)\text{\AA}$] π -ring interactions ($-x, 1-y, -x; x, 1/2-y, 1/2+z; 1-x, 1-y, 1-z$; $Cg(1) = C1-C6$ and $Cg(2) = C8-C13$ centroids, respectively) collectively provide added support to crystal stability.

After a MOPAC AM1 computational calculation (Schmidt & Polik, 2007), the nitro group now lies in the plane of the 2-aminobenzoyl group. The dihedral angle between the mean planes of the 2-aminobenzoyl and 2'-chlorobenzoyl planar groups becomes 88.6 (1) $^{\circ}$ while the dihedral angle between the mean planes of the carbonyl group (-C6-C7(O3)-C8-) and the mean planes of the 2-amino and 2'-chlorobenzoyl planar groups becomes 19.7 (3) $^{\circ}$ and 81.7 (1) $^{\circ}$, respectively. This supports the observation of a collective action of intermediate N-H \cdots O, C-H \cdots O hydrogen bonds, weak N-H \cdots Cl intermolecular interactions and weak C-Cl \cdots Cg, N-O \cdots Cg π -ring interactions influencing crystal packing stability.

S2. Experimental

The title compound was obtained as a gift sample from *R. L. Fine Chem*, Bangalore, India. The compound was used without further purification. Pale yellow crystals (m.p. 378–380 K) were obtained by slow evaporation from acetonitrile solution.

S3. Refinement

All of the H atoms were placed in their calculated positions and then refined using the riding model with N—H = 0.88, C—H = 0.95 Å, and with $U_{\text{iso}}(\text{H}) = 1.18\text{--}1.21U_{\text{eq}}(\text{C},\text{N})$.

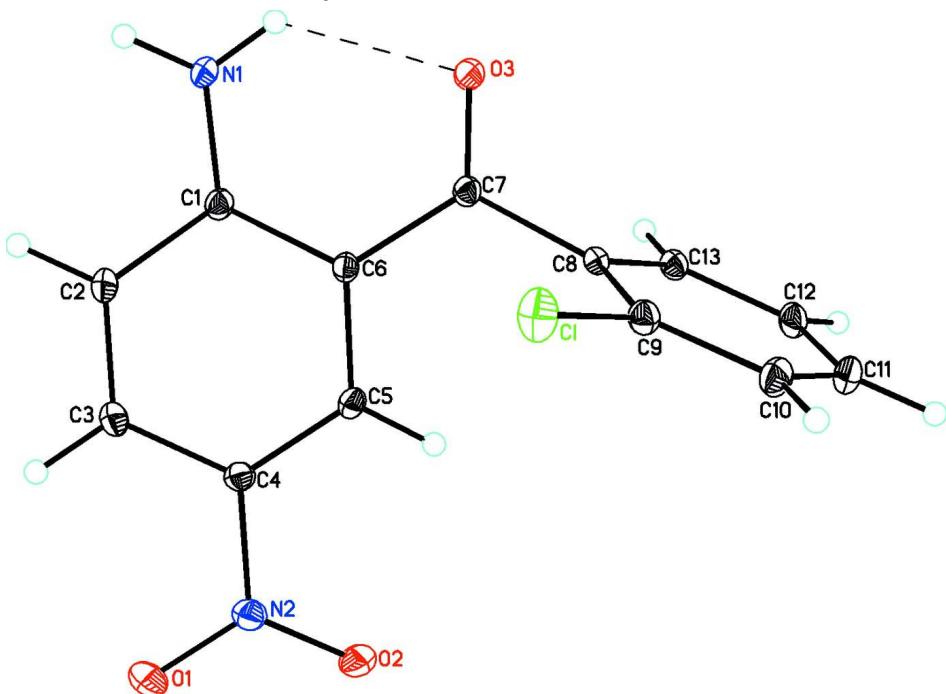

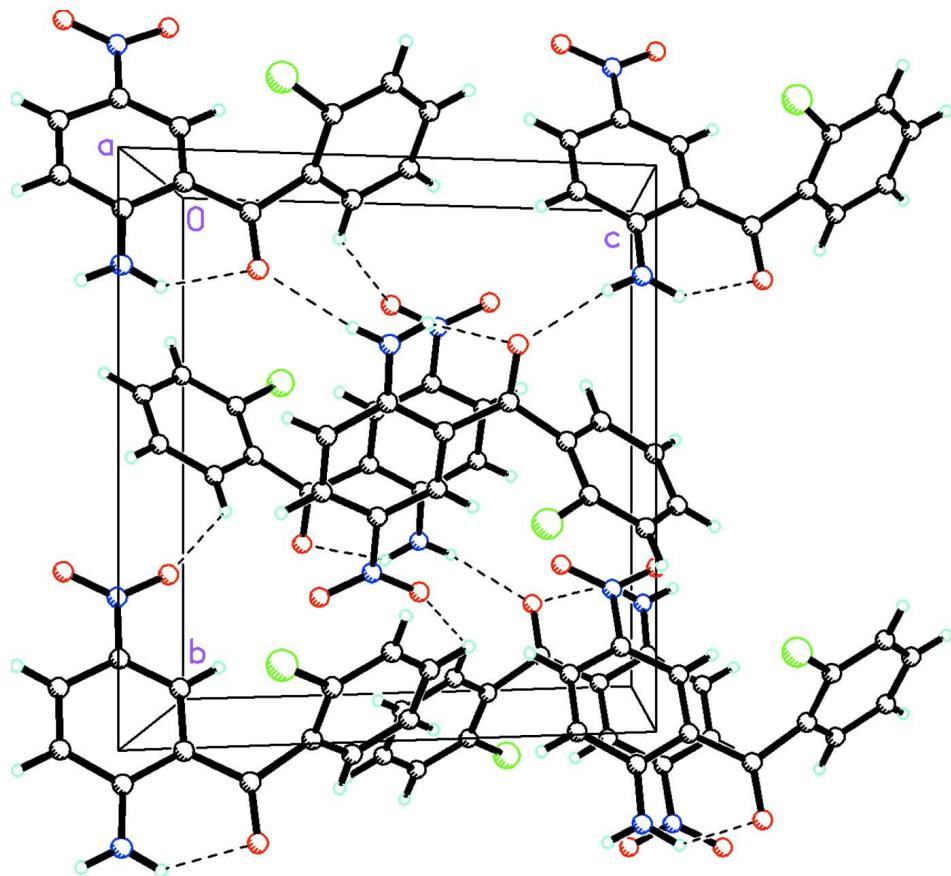

Figure 1

Molecular structure of the title compound showing the atom labeling scheme and 50% probability displacement ellipsoids. Dashed lines indicate hydrogen bonds.

**Figure 2**

Packing diagram of the title compound, viewed down the a axis. Dashed lines indicate intramolecular N-H \cdots O and intermediate intermolecular N-H \cdots O and C-H \cdots O hydrogen bonds in concert with weak N-H \cdots Cl interactions in the same direction producing an infinite, 2-dimensional intermolecular bonding network parallel to the (001) plane of the unit cell.

 $R_{\text{int}} = 0.021$
 $\theta_{\text{max}} = 32.7^\circ, \theta_{\text{min}} = 4.7^\circ$

Refinement

Refinement on F^2
 Least-squares matrix: full
 $R[F^2 > 2\sigma(F^2)] = 0.036$
 $wR(F^2) = 0.099$
 $S = 1.04$
 4131 reflections
 172 parameters
 0 restraints
 Primary atom site location: structure-invariant direct methods

$h = -15 \rightarrow 16$
 $k = -13 \rightarrow 16$
 $l = -16 \rightarrow 11$

Secondary atom site location: difference Fourier map
 Hydrogen site location: inferred from neighbouring sites
 H-atom parameters constrained
 $w = 1/[\sigma^2(F_o^2) + (0.0548P)^2]$
 where $P = (F_o^2 + 2F_c^2)/3$
 $(\Delta/\sigma)_{\text{max}} < 0.001$
 $\Delta\rho_{\text{max}} = 0.42 \text{ e } \text{\AA}^{-3}$
 $\Delta\rho_{\text{min}} = -0.27 \text{ e } \text{\AA}^{-3}$

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
