Received 18 July 2009; accepted 23 July 2009

Key indicators: single-crystal X-ray study; $T = 291\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.006\text{ \AA}$; R factor = 0.048; wR factor = 0.142; data-to-parameter ratio = 11.6.

In the title complex, $[\text{Co}(\text{C}_5\text{H}_3\text{N}_2\text{O}_4)_2(\text{H}_2\text{O})_2] \cdot 2\text{H}_2\text{O}$, the Co^{II} ion lies on an inversion center and is coordinated in a distorted octahedral environment. In the crystal structure, complex and water molecules are linked into a three-dimensional network by $\text{O}-\text{H}\cdots\text{O}$ and $\text{N}-\text{H}\cdots\text{O}$ hydrogen bonds.

Related literature

For a mononuclear zinc(II) complex with a pyrazole-3,5-dicarboxylato ligand, see: Xie *et al.* (2006) and for a cobalt(III) complex with a 5-carboxy-1*H*-pyrazole-3-carboxylato ligand, see: Xie *et al.* (2007). The 3,5-pyrazoledicarboxylic acid ligand is asymmetric and has six potential coordination sites which can act to link together metal centers through a number of bridging modes, see: King *et al.* (2004). A variety of complexes containing this ligand have been reported, see: Frisch & Cahill (2005); King *et al.* (2003, 2004); Li *et al.* (2005); Pan, Ching *et al.* (2001); Pan, Frydel *et al.* (2001).

Diaquabis(5-carboxy-1*H*-pyrazole-3-carboxylato- κ^2N^2,O^3)cobalt(II) dihydrate

Hui-Dong Xie, Li Jin and Cheng-Zhi Xie

S1. Comment

In the past few decades, self-assembly processes involving metal ions and organic ligands directed by either metal coordination or hydrogen bonds have received a great deal of attention in the field of supramolecular chemistry and crystal engineering. The 3,5-pyrazoledicarboxylic acid ligand is asymmetric and has six potential coordination sites which can act to link together metal centers through a number of bridging modes (King *et al.*, 2004). A variety of complexes containing this ligand have been reported (Frisch *et al.*, 2005; King *et al.*, 2003, 2004; Pan, Ching *et al.*, 2001; Pan, Frydel *et al.*, 2001; Li *et al.*, 2005).

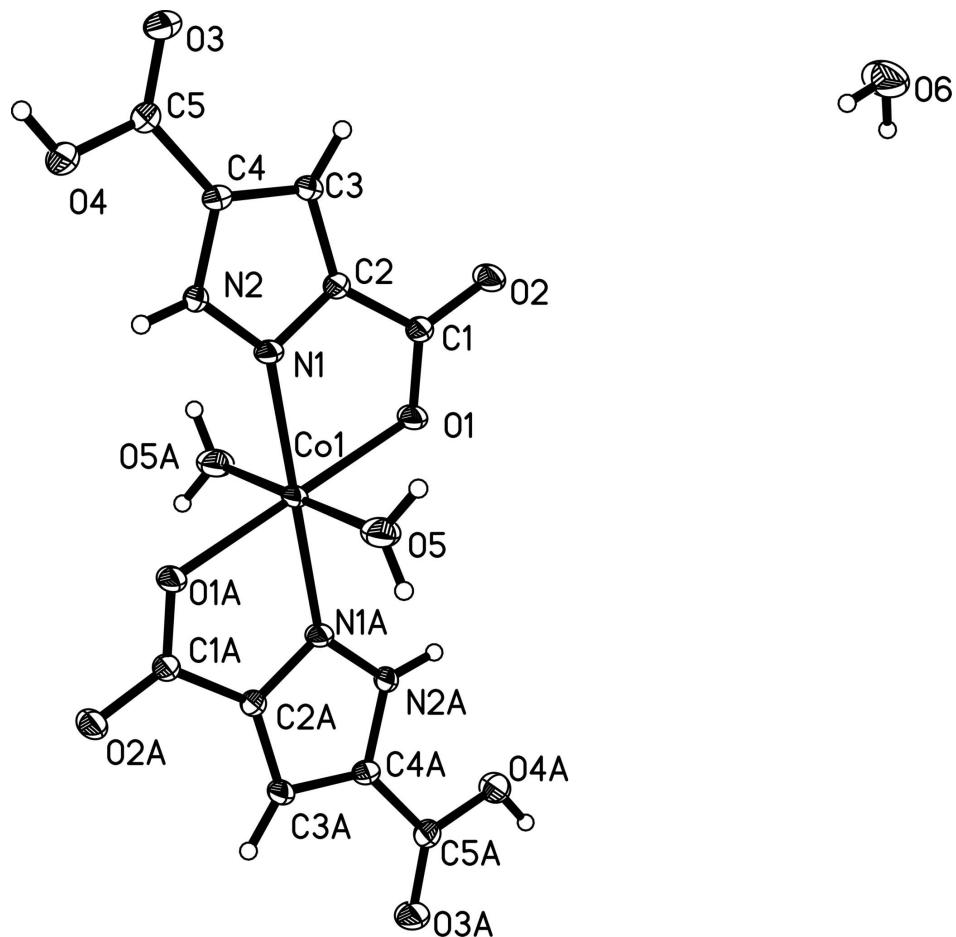

The molecular structure of the title complex , (I), is shown in Fig. 1. The Co^{II} ion is located on an inversion center and is coordinated in a distorted octahedral environment. The axial sites are occupied by water molecules and the equatorial plane is fromed by two oxygen donors and two nitrogen donors from two chelating 5-carboxy-pyrazole-3-carboxylato ligands. In the crystal structure complex and water molecules are linked into a three-dimensional network by O-H···O and N-H···O hydrogen bonds.

S2. Experimental

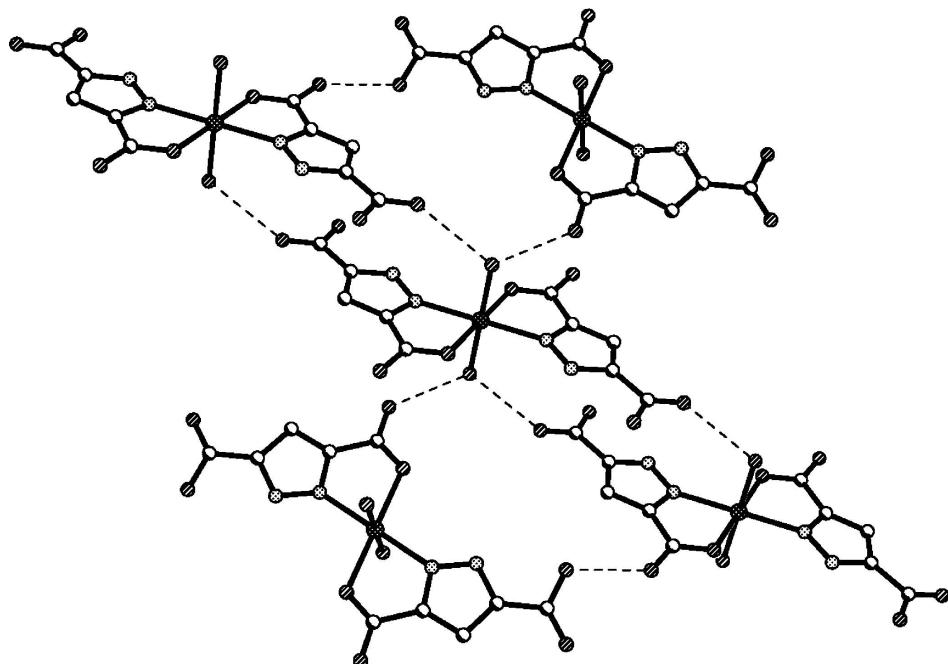

A mixture of cobalt(II) nitrate (hexhydrate) (0.2 mmol, 58 mg), 3,5-pyrazoledicarboxylic acid (0.4 mmol, 62 mg) and H₂O (18.0 ml) in a 1:2:5000 molar ratio was sealed in a 25 ml stainless steel reactor with a Teflon liner. The autoclave was kept at 423 K for 3 d, then cooled to room temperature at a rate of 4 K/h. Orange block-shaped crystals of the title complex were collected by filtration for the structural analysis.

S3. Refinement

All H atoms bonded to C and N atoms were initially located in difference Fourier maps but were subsequently refined in a riding-model approximation with C—H = 0.93 Å, N—H = 0.86 Å, $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C},\text{N})$. The O atoms bonded to the carboxylic group and the coordinated water atom were included in calculated positions and refined in a riding-model approximation with O-H = 0.82–0.83 Å and $U_{\text{iso}}(\text{H}) = 1.2\text{--}1.5U_{\text{eq}}(\text{O})$. One of the solvent water H atoms was included with O-H = 0.84; $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{O})$ and the other H atom was refined isotropically.

**Figure 1**

The molecular structure of (I), with atom labels and 35% probability displacement ellipsoids for non-H atoms [symmetry code: (A) $-x+1, -y+2, -z$]. Only the unique solvent water molecule is shown.

**Figure 2**

Part of the crystal structure of (I) showing the donor acceptor distances of hydrogen bonds as dashed lines. H atoms have been omitted for clarity.

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
