Received 4 August 2009; accepted 5 August 2009

 Key indicators: single-crystal X-ray study; $T = 293$ K; mean $\sigma(\text{C}-\text{C}) = 0.008$ Å; disorder in solvent or counterion; R factor = 0.049; wR factor = 0.116; data-to-parameter ratio = 11.7.

The asymmetric unit of title compound, $[\text{Cu}(\text{NCS})\text{-(C}_{10}\text{H}_8\text{N}_2)_2]\text{ClO}_4$, contains a bis(2,2'-bipyridine)(isothiocyanato)copper(II) cation and a perchlorate anion. In the cation, the Cu^{2+} ion is coordinated by four N atoms from two bidentate 2,2'-bipyridine molecules and an N atom from an isothiocyanate anion, resulting in a distorted CuN_5 pyramidal configuration. The crystal structure is stabilized by weak intermolecular $\text{C}-\text{H}\cdots\text{O}$ and $\text{C}-\text{H}\cdots\text{S}$ hydrogen bonds, and weak $\pi-\pi$ interactions between 2,2'-bipyridine rings [centroid-centroid distance = 3.908 (4) Å]. The perchlorate counteranion is disordered over two positions in a 0.66:0.34 ratio.

Bis(2,2'-bipyridine- κ^2N,N')(thiocyanato- κN)copper(II) perchlorate

Q. Li, D. Zhang, C.-L. Chen and L. Yan

Comment

Recently, more attentions have been paid to metal-organic coordination compounds (MOCPs) due to their potential applications in catalysis, nonlinear optics, gas absorption, luminescence and magnetism (MasPOCH *et al.* 2007, Kitagawa & Matsuda 2007). In the field of coordination chemistry, dual-ligand or multidentate ligands are usually engaged in the construction of MOCPs, among which *N,N*-bidentate ligands (such as 2,2'-bipyridine) is familiar chelate ligand. Herein, we report the structure of the title compound (I) containing organic dual ligands.

The title compound (I) consists of one $[\text{Cu}(\text{C}_{10}\text{H}_8\text{N}_2)_2(\text{SCN})]^+$ complex cations, one disordered $[\text{ClO}_4]^-$ anion (Fig.1). In the molecular structure, the Cu^{2+} centre is coordinated by five N atoms, among which four N atoms come from two bidentate 2,2'-bipyridine molecule and another one N atom from an isothiocyanato anion. The environment of the Cu^{2+} cation is in a distorted pyramidal geometry with Cu–N bond lengths ranging from 1.968 (4) to 2.102 (4) Å (Table 1).

In addition, the crystal structure is stability by weak intermolecular C—H \cdots O and C—H \cdots S hydrogen bonds (Table 2), and weak π - π interactions between 2,2'-bipyridine rings with centroid-to centroid distance of 3.908 (4) Å.

Experimental

2,2'-Bipyridine (1 mol, 0.16 g) was suspended in 20 ml

ethanol solution, to which $\text{Cu}(\text{ClO}_4)\cdot 2\text{H}_2\text{O}$ (0.5 mmol, 0.19 g) was added, and then KSCN (0.5 mmol, 0.5 g) were added to the mixture. It was stirred under reflux for 4 h. The solution was cooled and filtered, and the filtrate was kept at the room temperature. After ten days, green blocks of (I) were obtained.

Refinement

H atoms were treated as riding, with C—H distances of 0.93 Å, and were refined as riding with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$.

Figures

Fig. 1. The molecular structure of (I), showing the atom-labelling scheme. Displacement ellipsoids are drawn at the 50% probability level. Hydrogen atoms are omitted for clarity.

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.049$	H-atom parameters constrained
$wR(F^2) = 0.116$	$w = 1/[\sigma^2(F_o^2) + (0.0453P)^2]$
$S = 1.03$	where $P = (F_o^2 + 2F_c^2)/3$
3917 reflections	$(\Delta/\sigma)_{\text{max}} < 0.001$
335 parameters	$\Delta\rho_{\text{max}} = 0.60 \text{ e \AA}^{-3}$
44 restraints	$\Delta\rho_{\text{min}} = -0.82 \text{ e \AA}^{-3}$
Primary atom site location: structure-invariant direct methods	Extinction correction: none

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
