 Key indicators: single-crystal X-ray study;  $T = 298$  K; mean  $\sigma(C-C) = 0.007$  Å;  $R$  factor = 0.062;  $wR$  factor = 0.121; data-to-parameter ratio = 12.7.

In the title complex,  $[Cu(C_{21}H_{14}NO)_2]$ , the  $Cu^{II}$  atom, lying on an inversion center, is coordinated by two bidentate 1-(2-naphthyliminomethyl)-2-naphtholate ligands in a *trans* arrangement, forming a slightly distorted square-planar coordination geometry. The mean planes of two naphthyl systems of the ligand make a dihedral angle of  $40.32(11)^\circ$ .

### Comment

Schiff base complexes play an important role in the stereochemical models of transition metal coordination chemistry, with their easy preparation, diversity and structural variation (Gamovski *et al.*, 1993). They also have been intensively investigated owing to their strong coordination capability and diverse biological activities, such as antibacterial, and antitumor activities (Tarafder *et al.*, 2002; Yang *et al.*, 2000). As part of a series of the studies (Wang *et al.*, 2007), we report here the synthesis and structure of the title compound, a new copper(II) complex with a bidentate Schiff base ligand derived from the condensation of 2-hydroxy-1-naphthylaldehyde and 2-naphthylamine.

The molecular structure of the title complex is shown in Fig. 1. The Cu<sup>II</sup> atom, lying on an inversion center, is coordinated by two bidentate ligands in a *trans* arrangement, forming a CuN<sub>2</sub>O<sub>2</sub> square-planar configuration (Table 1), with the typical values of Cu—O and Cu—N bond lengths (Unver *et al.*, 2003). The mean planes of the chelate ring N1, C1, C2, C3, O1, Cu1 (A), bicycles C2—C11 (B) and C12—C21 (C) make the following dihedral angles: A/B 18.92 (19), A/C 58.14 (12) and B/C 40.32 (11)°. Additionally, the relatively short intermolecular distance H12...C7<sup>i</sup> (symmetry code: (i)  $x + 1, y, z$ ) of 2.90 Å indicates the possible presence of C—H... $\pi$  interaction, which forms a one-dimensional chain structure (Fig. 2).

### Experimental

2-Naphthylamine (0.143 g, 1 mmol) was dissolved in hot methanol (10 ml) and added dropwise to a methanol solution (3 ml) of 2-hydroxy-1-naphthylaldehyde (0.172 g, 1 mmol). The mixture was then stirred at 323 K for 2 h. Subsequently, an aqueous solution (2 ml) of cupric acetate hydrate (0.200 g, 1 mmol) was added dropwise and stirred for another 5 h. The solution was held at room temperature for 15 d, whereupon green needle crystals suitable for X-ray diffraction were obtained.

### Refinement

H atoms were positioned geometrically and refined as riding atoms, with C—H = 0.93 Å and with  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$ .

### Figures
