Received 14 January 2010; accepted 18 January 2010

The chemical name of the title compound in the paper by Ogawa, Kajita & Masuda [*Acta Cryst.* (2009), **E65**, m1129] is corrected.

In the paper by Ogawa *et al.* (2009), the chemical name given in the *Title* should be ‘Tetrachloridobis[(diphenylphosphino)diphenylphosphine oxide- κO]zirconium(IV) benzene monosolvate’.

ReferencesOgawa, T., Kajita, Y. & Masuda, H. (2009). *Acta Cryst.* **E65**, m1129.

Tetrachlorido[(diphenylphosphino)-diphenylphosphine oxide- κO]-zirconium(IV) benzene monosolvate

Takahiko Ogawa, Yuji Kajita and Hideki Masuda*

Received 10 August 2009; accepted 12 August 2009

Key indicators: single-crystal X-ray study; $T = 173\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.006\text{ \AA}$;
 R factor = 0.045; wR factor = 0.151; data-to-parameter ratio = 19.2.

In the title centrosymmetric mononuclear Zr^{IV} compound, $[\text{ZrCl}_4\{\text{P}(\text{O})(\text{C}_6\text{H}_5)_2\text{P}(\text{C}_6\text{H}_5)_2\}_2]\cdot\text{C}_6\text{H}_6$, the central Zr^{IV} ion is coordinated by two O atoms from two symmetry-related (diphenylphosphino)diphenylphosphine ligands and four Cl atoms in a distorted octahedral geometry with the four Cl atoms in the equatorial positions. The molecule lies about a center of inversion and the benzene solvent molecule about another center of inversion. The $\text{P}=\text{O}$ bond [1.528 (2) \AA] is slightly longer than a typical $\text{P}=\text{O}$ double bond (average 1.500).

Tetrachlorido[(diphenylphosphino)diphenylphosphine oxide- κO]zirconium(IV) benzene monosolvate

Takahiko Ogawa, Yuji Kajita and Hideki Masuda

S1. Comment

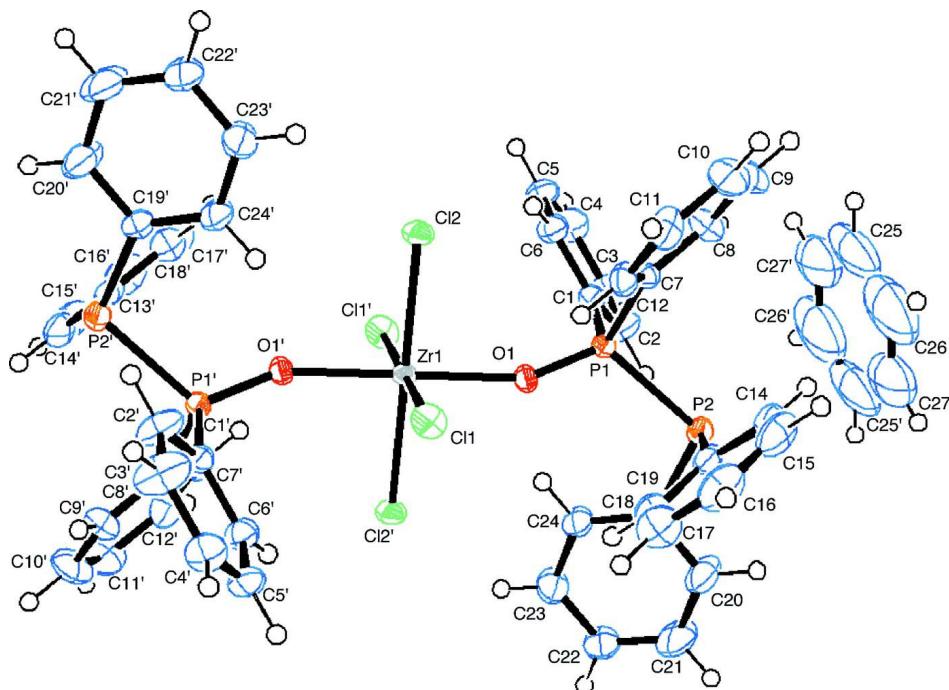

The phosphinoyl derivative, (diphenylphosphino)diphenylphosphine (DPDP), has a unique structure and coordination mode (Ferguson 1990 and Muratova *et al.*, 1980). The complex which contains DPDP ligands is very rare and is a novel Zr^{IV} complex with DPDP ligand (Kuramshin & Khramov *et al.*, 1983). The centrosymmetric unit of the title compound, [ZrCl₄(C₂₄H₂₀P₂O)₂] C₆H₆, contains a neutral Zr^{IV} complex and a solvent benzene molecule (Fig. 1). The compound crystallized in the triclinic space group $P\bar{1}$. In the complex, the Zr^{IV} ion is six-coordinated in a slightly distorted octahedral environment by two O atoms of DPDP ligand and four Cl ions. The P atoms do not coordinate to the Zr^{IV} atom. The Zr—Cl(1) [2.4450 (9) Å] and Zr—Cl(2) [2.4627 (9) Å] bond lengths are slightly different each other (Table 1). The P—O bond length [1.5281 (19) Å] is slightly longer compared with a typical double bond (Berners-Price *et al.*, 2009). The P—P bond length [2.2057 (10) Å] is similar to several P^{III}—P^V derivatives.

S2. Experimental

The title compound was prepared by the reaction of ZrCl₄ (0.03 g, 0.13 mmol) and (diphenylphosphino)diphenylphosphine (0.10 g, 0.26 mmol) in benzene (5 ml). The mixture was filtered and set aside to crystallize at ambient temperature for several days, giving colorless single crystals.

S3. Refinement

All H atoms were positioned geometrically and refined as riding atoms, with C—H = 0.95 Å and $U_{\text{iso}}(\text{H}) = 1.2 U_{\text{eq}}(\text{C})$. The final difference Fourier map had a peak near the Zr1 atom.

**Figure 1**

The molecular structure of the title molecule, with the atom-numbering scheme. Displacement ellipsoids are drawn at the 50% probability level. Primed atoms are generated by the symmetry operator ((i) $-x + 2, -y, -z + 2$; (ii) $-x + 1, -y + 1, -z + 1$).

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement was performed using all reflections. The weighted R -factor (wR) and goodness of fit (S) are based on F^2 . R -factor (gt) are based on F . The threshold expression of $F^2 > 2.0 \sigma(F^2)$ is used only for calculating R -factor (gt).
