Received 22 July 2009; accepted 29 July 2009

Key indicators: single-crystal X-ray study; $T = 298\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.003\text{ \AA}$; R factor = 0.041; wR factor = 0.048; data-to-parameter ratio = 16.1.

The analysis of the title chiral auxiliary compound, $\text{C}_{13}\text{H}_{15}\text{NOS}_2$, has enabled the determination of the absolute configuration at the benzyl-bearing ring C atom as *S*. In the crystal structure, molecules aggregate into helical chains along the *b* axis via $\text{C}-\text{H}\cdots\text{O}$ contacts.

Narendar Reddy Gade, Y. Manjula, Javed Iqbal and Peddy Vishweshwar

S1. Comment

N-Acyl thiazolidinethiones, e.g. (I), are versatile chiral auxiliaries for asymmetric aldol reactions Crimmins & Chaudhary (2000). Many complex natural products have been synthesized using these auxiliaries (Crimmins *et al.* 2005; Crimmins & Haley, 2006; Crimmins & Dechert, 2009). The synthesis of (I) starts from amino alcohol **2** which was converted to thiazolidinethione **3** by reacting with carbon disulfide followed by treatment with propionyl chloride (Fig. 3) (Crimmins & Chaudhary, 2000).

The single crystal analysis of (I), Fig. 1, allowed the determination of the absolute configuration of C1 as S. The crystal structure shows the molecules to aggregate into helical chains along the screw axis via C₉—H₉···O₁ contacts (Fig. 2, Table 1).

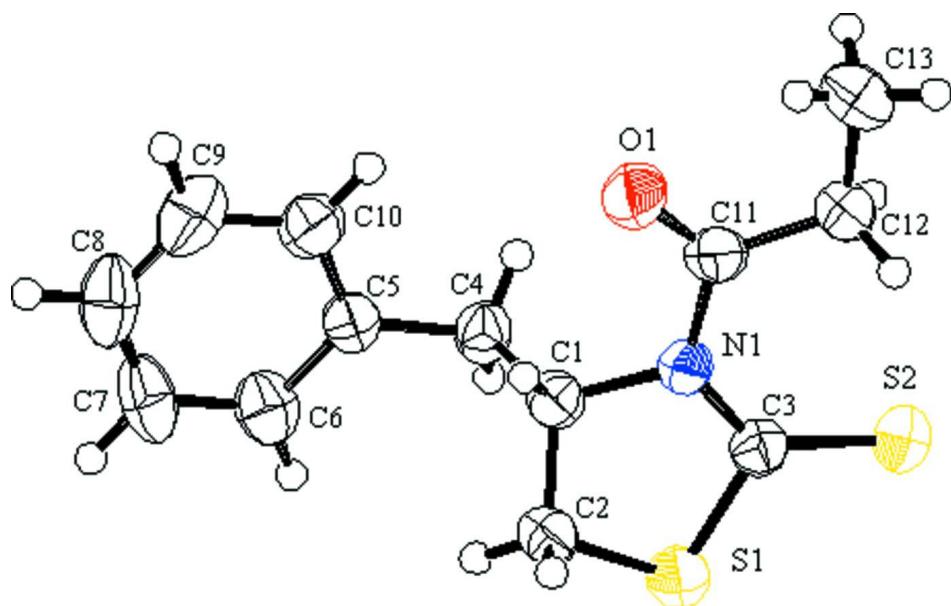

S2. Experimental

To a solution of β -amino alcohol **2** (10 mmol) (McKennon & Meyer, 1993) in aqueous 1.0 N potassium hydroxide (50 ml) was added carbon disulfide (50 mmol, 3.0 ml) slowly. The reaction mixture was refluxed at 110 °C for 12 h to give the desired thiazolidinethione **3** (Delaunay *et al.* 1995). To a solution of compound **3** (0.478 mmol) in dichloromethane (DCM, 3 ml) was added triethylamine (0.956 mmol) and the temperature was maintained at -40 to -78 °C. To that mixture was added propionyl chloride (0.574 mmol) drop wise. The mixture was stirred for 1–2 h, diluted with DCM (10 ml), washed with water (2 x 10 ml), dried over anhydrous Na₂SO₄ and concentrated low vacuum to give (I) as a light-yellow solid; mp. 374–376 K (lit. mp. 374.1 K (Lu *et al.* 2009)).

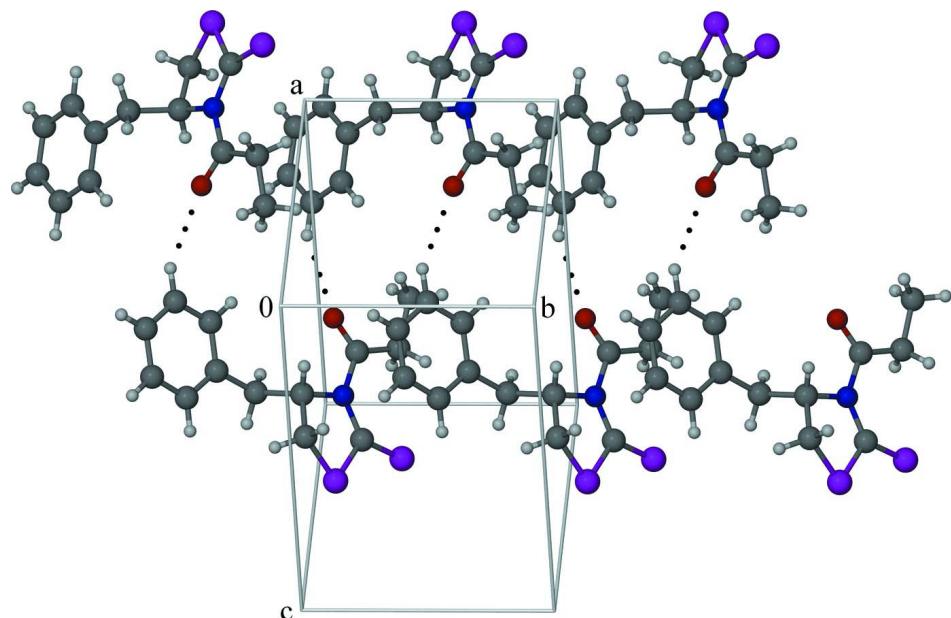

Compound (I) (50 mg) was dissolved in 2:1 DCM/EtOAC (1.0 ml) and left in freezer (10 °C) until fine crystals appeared. Crystals were separated from soluton and washed with hexane and dried under vacuum.

S3. Refinement

The H atoms were positioned geometrically and refined in the riding model approximation with C—H = 0.95 Å, and with U_{iso}(H) set to 1.2U_{eq}(C).

**Figure 1**

Molecular structure of (I) showing the atom numbering scheme. The displacement ellipsoids are drawn at the 50% probability level. H-atoms are shown by small circles of arbitrary radii.

**Figure 2**

Crystal packing of (I) showing the formation of helical chains. The C-H...O contacts are shown as dashed lines.

 $\Delta\rho_{\text{min}} = -0.35 \text{ e } \text{\AA}^{-3}$
 Absolute structure: Flack (1983), 1138 Friedel pairs
 Absolute structure parameter: -0.05 (6)

Special details

Geometry. Bond distances, angles *etc.* have been calculated using the rounded fractional coordinates. All su's are estimated from the variances of the (full) variance-covariance matrix. The cell e.s.d.'s are taken into account in the estimation of distances, angles and torsion angles

Refinement. Refinement was performed using all reflections. The weighted R -factor (wR) and goodness of fit (S) are based on F^2 . R -factor (gt) are based on F . The threshold expression of $F^2 > 2.0 \sigma(F^2)$ is used only for calculating R -factor (gt).
