Key indicators: single-crystal X-ray study;  $T = 293\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.014\text{ \AA}$ ;  
 $R$  factor = 0.064;  $wR$  factor = 0.211; data-to-parameter ratio = 17.1.

The conformation of the N–H bond in the title compound,  $\text{C}_{12}\text{H}_{16}\text{BrNO}$ , is *syn* to the *ortho*-methyl substituent. There are two unique molecules in the asymmetric unit. In the crystal structure, intermolecular N–H···O hydrogen bonds link the molecules, forming infinite chains down [010].

## N-(4-Bromo-2-methylphenyl)pivalamide

Wei-Xia Qing and Wei Zhang

### S1. Comment

As part of a study of the effect of ring and side chain substitutions on the crystal structures of chemically and biologically important class of compounds such as aromatic amides (Gowda, Kozisek *et al.*, 2007), We now report the the crystal structure of the title compound, (I).

As shown in Fig.1, the title compound includes both the *ortho*-methyl and the *p*-Br-substituted phenyl group and an imide group. The title compound, (I), (Fig. 1) is structural isomer of both the 2-chloro and the 3-chloro substituent in *N*-(2,3-dichlorophenyl)acetamide (Gowda *et al.*, 2007a) and *N*-(2,3-Dichlorophenyl)-2,2,2-trimethylacetamide (Gowda *et al.*, 2007b). The conformation of the N—H bond in the title compound is *syn* to the *ortho*-methyl substituent, similar to that in both the 2-chloro and the 3-chloro-substituted amides, but in contrast to the *anti* conformation observed for the corresponding 3-chloro-substituted *N*-(3-Chlorophenyl)-2,2,2-trimethylacetamide (Gowda *et al.*, 2007c). The amide H atom is involved in an intramolecular hydrogen bond with the O atom of the carbonyl group.

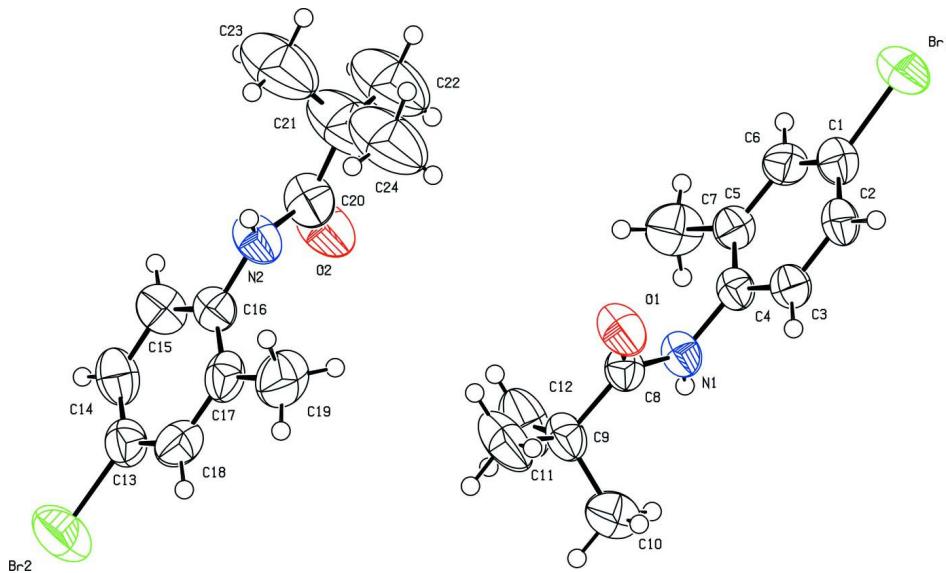

In the crystal structure, these molecules are linked into infinite one-dimensional chains by intermolecular N—H···O hydrogen bonds running along [010] direction (Fig. 2, Table 1).

### S2. Experimental

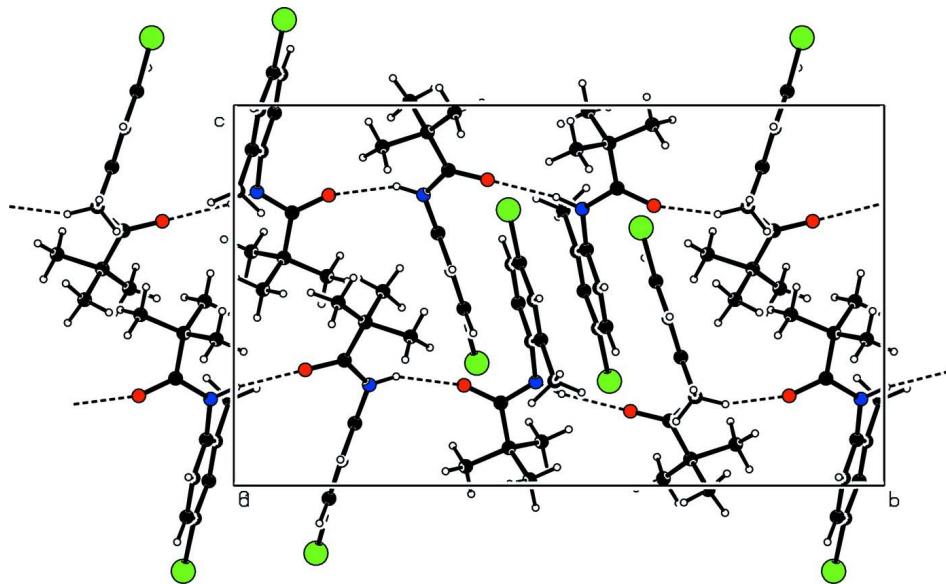

2,2,2-Trimethyl-*N*-(2-methylphenyl)acetamide (0.95 5 g, 5 mmol) was added slowly by cannulation to a stirred suspension of *p*-nitroaniline (0.690 g, 3 mmol) in chloroform (50 ml) at room temperature. After stirring for 2 h the solution was quenched with saturated aqueous sodium bicarbonate solution (20 ml) the layers were separated and the aqueous layer was extracted with chloroform, the combined organic extracts were washed with water (20 ml), dried ( $\text{MgSO}_4$ ) and evaporated under reduced pressure to give the crude product as viscous brown oil. Then purification by short column chromatography (chloroform) and recrystallization from chloroform gave the compound (I) as brown needles crystals (1.094 g, 81%).

### S3. Refinement

H atoms were treated as riding, with C—H distances in the range of 0.93–0.96 Å and N—H distances of 0.86 Å, and were refined as riding with  $U_{\text{iso}}(H) = 1.2U_{\text{eq}}(\text{N and C in phenyl ring})$  and  $U_{\text{iso}}(H) = 1.5U_{\text{eq}}(\text{C}_\text{methyl})$ .

**Figure 1**

The molecular structure of (I), showing the atom-labelling scheme. Displacement ellipsoids are drawn at the 50% probability level.

**Figure 2**

One-dimensional structure of (I) along [010] direction, Hydrogen bonds are shown in the dashing line.

 Primary atom site location: structure-invariant  
 direct methods

Secondary atom site location: difference Fourier  
 map  
 Hydrogen site location: inferred from  
 neighbouring sites  
 H-atom parameters constrained  
 $w = 1/[\sigma^2(F_{\text{o}}^2) + (0.0858P)^2 + 4.1364P]$   
 where  $P = (F_{\text{o}}^2 + 2F_{\text{c}}^2)/3$   
 $(\Delta/\sigma)_{\max} = 0.001$   
 $\Delta\rho_{\max} = 0.90 \text{ e \AA}^{-3}$   
 $\Delta\rho_{\min} = -0.70 \text{ e \AA}^{-3}$

#### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
