Received 1 September 2009; accepted 7 September 2009

Key indicators: single-crystal X-ray study; $T = 293$ K; mean $\sigma(\text{Eu}-\text{O}) = 0.003$ Å; R factor = 0.019; wR factor = 0.048; data-to-parameter ratio = 13.9.

Caesium europium polyphosphate, CsEu(PO₃)₄, was synthesized by a high-temperature solution reaction. Its structure is characterized by a three-dimensional framework made up of double PO₄ spiral chains and EuO₈ and CsO₁₁ polyhedra.

Comment

Condensed alkaline metal-rare earth polyphosphates with the general formula $M\text{Ln}(\text{PO}_3)_4$ (M = alkali metal, Ln = rare earth metal) possess various structures (Ettis *et al.*, 2003; Rekik *et al.*, 2004) and desirable optical properties (Chinn *et al.*, 1975; Otsuka *et al.*, 1977; Tsujimoto *et al.*, 1977; Hong *et al.*, 1975; Koizumi *et al.*, 1976). Furthermore, their chemical and thermal stability ensures the feasibility of the industrial applications. For this reason some polyphosphates (Naïli *et al.*, 2005; Palkina *et al.*, 1978; Maksimova *et al.*, 1982) were synthesized and investigated in the Cs–Ln–P–O system as an important potential. However, polyphosphates containing europium have not to date been fully explored in the system. Our exploration on the system afforded caesium europium polyphosphate CsEu(PO₃)₄. We report herein the synthesis and crystal structure of CsEu(PO₃)₄.

Crystallographic data and structural refinement of CsEu(PO₃)₄ are summarized in Table 1. The atomic coordinates and thermal parameters are listed in Table 2. Selected bond lengths and angles are given in Table 3.

The structure of crystal CsEu(PO₃)₄ is shown in Fig. 1. It belongs to the monoclinic space group $P2_1/n$, which is isostructural with CsGd(PO₃)₄ (Naïli *et al.*, 2005). The crystallographically distinct atoms of the asymmetric unit in the structure are one caesium, one europium, four phosphorus, and twelve oxygen atoms. It is described as a three-dimensional framework made up from double PO₄ spiral chains and Cs- and Eu-polyhedra. As illustrated in Fig. 2, the double PO₄ spiral chains have the same repeating unit (eight PO₄ tetrahedra) as single one of CsNd(PO₃)₄ (Koizumi *et al.*, 1978). These spiral chains are linked by EuO₈ and CsO₁₁ polyhedra. In addition, comparing with CsNd(PO₃)₄, the different characteristics are noted in the coordination environments of the cations. The Eu cation is eight-coordinated with the Eu—O bond distances ranging from 2.344 (3) to 2.471 (3) Å. Each EuO₈ polyhedron is corner- and face-connected with two and two CsO₁₁ polyhedra, respectively (Fig. 3). The isolation of EuO₈ polyhedra gives rise to the large Eu—Eu distances, the shortest of which is 5.7415 (3) Å. The Cs cation is coordinated by eleven oxygen atoms, and the large range of the Cs—O bond distances implies that CsO₁₁ polyhedra are distorted. Neighboring two CsO₁₁ polyhedra are linked by corner-sharing (Fig. 4).

Experimental

The title compound was prepared by the high temperature solution reaction, using analytical reagents Cs₂CO₃, Eu₂O₃, and NH₄H₂PO₄ in the molar ratio of Cs/Eu/P = 7:1:12. Starting mixtures were finely ground in an agate mortar to ensure the best homogeneity and reactivity, then placed in a platinum crucible and heated at 373 K for 4 h. Afterwards, the mixtures were reground and heated to 973 K for 24 h. Finally, the temperature was cooled to 773 K at a rate of 2 K/h and air-quenched to room temperature. A few colorless and block-shaped crystals were obtained from the melt of the mixture.

Refinement

A single-crystal of the compound was selected for X-ray Diffraction determination. The structure was solved using direct methods and refined on F2 by the full-matrix least-squares method with the *SHELXL97* program package (Sheldrick, 2008). The position of the Eu atom was refined by the application of the direct method, and the remaining atoms were located in succeeding difference Fourier synthesis. In order to confirm the chemical composition of the compound, the single-crystal investigated on the diffractometer was analyzed by Energy-dispersive X-ray spectrometry (EDX) using a JSM6700F scanning electron microscope. The obtained result is in good agreement with that obtained by the refinement of the crystal structure. No impurity elements have been detected.

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
