Key indicators: single-crystal X-ray study; $T = 293$ K; mean $\sigma(C-C) = 0.006$ Å;
 R factor = 0.023; wR factor = 0.062; data-to-parameter ratio = 10.7.

In the title coordination polymer, $[AgTb(C_7H_3NO_4)(C_7H_4NO_4)(C_2O_4)_{0.5}(H_2O)_2]_n$, the Tb^{III} ion is eight-coordinated by three O atoms from three different pydc (H_2 pydc = pyridine-3,5-dicarboxylic acid) ligands, one O atom from one Hpydc ligand, two O atoms from one oxalate ligand and two water molecules in a distorted square-antiprismatic geometry. The Ag^I ion is coordinated in an almost linear fashion by two pyridyl N atoms from one pydc and one Hpydc ligand and has weak interactions with two carboxylate O atoms. The carboxylate groups of pydc and Hpydc ligands link Tb centers, forming a one-dimensional chain. The oxalate adopts a tetradentate bis-chelating coordination mode, connecting the chains into a two-dimensional layer. These layers are further assembled via [Ag(pydc)(Hpydc)] pillars and O—H···O and C—H···O hydrogen bonds into a three-dimensional coordination framework.

S1. Comment

The design and construction of transition–lanthanide metal complexes has gained great recognition over the last decade because of their intriguing network topologies and potential applications, and due to their magnetic properties, their capacity for gas storage, as luminescent materials, and so on (Barbour, 2006; Kepert, 2006; Kong *et al.*, 2008; Rao *et al.*, 2004; Zhang *et al.*, 2005). Pyridine-3,5-dicarboxylic acid (H₂pydc) is a multifunctional bridging ligand possessing of O and N donors, which can thus be chosen to construct lanthanide–transition heterometallic complex *via* the carboxyl O atoms binding to lanthanides and N atoms bonding to transition metal ions such as Ag^I or Cu^I (Wu *et al.*, 2008). On the basis of above considerations, we utilize H₂pydc, mixed 4d–4f metal ions and nitric acid as our building blocks. A new three-dimensional 4d–4f coordination framework resulted from the hydrothermal treatment of Tb₂O₃, AgNO₃, oxalic acid, H₂pydc and nitric acid in water.

As depicted in Fig. 1, the asymmetric unit of the title compound contains one Tb^{III} ion, one Ag^I ion, half an oxalate ligand, one pydc ligand, one Hpydc ligand and two water molecules. The Tb^{III} ion is eight-coordinated in a distorted square-antiprismatic coordination geometry by three O atoms from three different pydc ligands, one O atom from one Hpydc ligand, two O atoms from one oxalate ligand and two water molecules. The Ag^I ion is located in an almost linear configuration, defined by two N atoms from one pydc and one Hpydc ligands. The carboxylate groups of the pydc and Hpydc ligands link Tb^{III} center to form a one-dimensional chain with a shortest Tb···Tb distance of 5.261 (3) Å (Fig. 2a). The oxalate adopts tetradentate bischelating coordination mode to connect the neighboring chains into a two-dimensional layer (Fig. 2b). These layers are further assembled *via* [Ag(pydc)(Hpydc)] pillars into a three-dimensional coordination framework (Fig. 3). O—H···O and C—H···O hydrogen bonds (Table 1) involving the carboxyl group and coordinated water molecules enhance the stability of the three-dimensional network.

S2. Experimental

A mixture of Tb₂O₃ (0.183 g, 0.5 mmol), AgNO₃ (0.169 g, 1 mmol), H₂pydc (0.167 g, 1 mmol), oxalic acid (0.09 g, 1 mmol), HNO₃ (0.12 ml) and H₂O (10 ml) was placed in a 23 ml Teflon-lined reactor, which was heated to 443 K for 3 d and then cooled to room temperature at a rate of 10 K h⁻¹. The colorless block crystals obtained were washed with water and dried in air (yield 46% based on Tb).

S3. Refinement

C-bound H atoms were placed at calculated positions and treated as riding on the parent C atoms, with C—H = 0.93 Å, and with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$. Water H atoms were tentatively located in difference Fourier maps and refined with distance restraints of O—H = 0.84 (1) and H···H = 1.39 (1) Å, and with $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{O})$. Carboxyl H (H3A) atom was

refined isotropically.

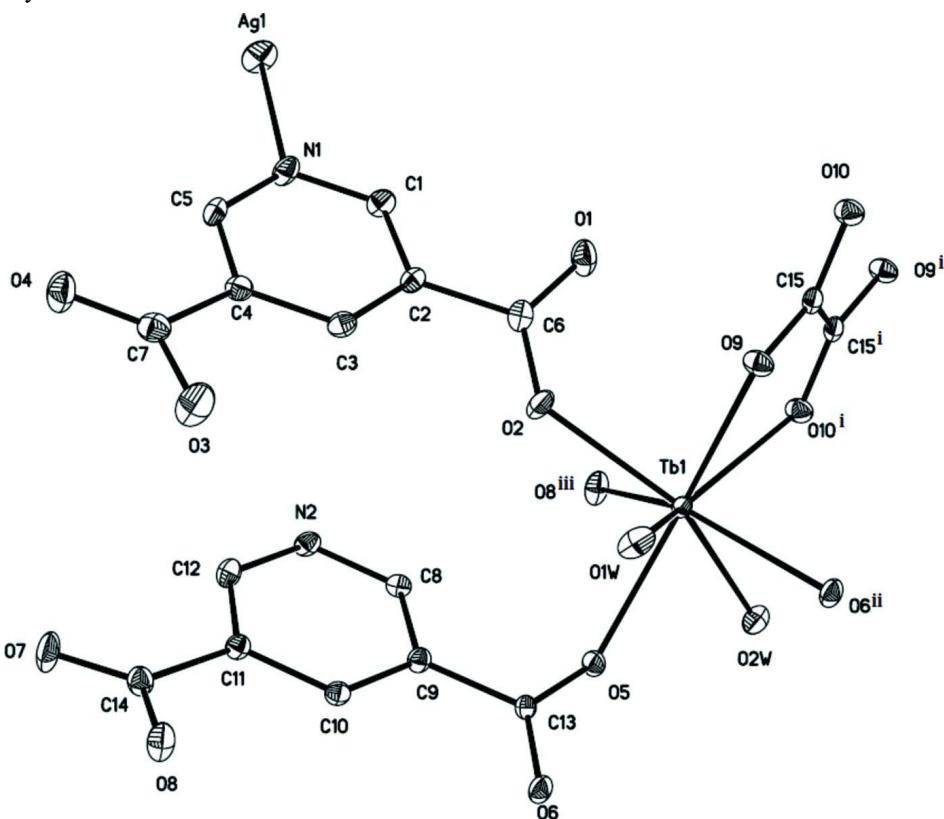

Figure 1

The asymmetric unit of the title compound. Non-H atoms are shown as 50% probability displacement ellipsoids. H atoms have been omitted for clarity. [Symmetry codes: (i) $1-x, -y, -z$; (ii) $2-x, 1-y, -z$; (iii) $x, -1+y, z$.]

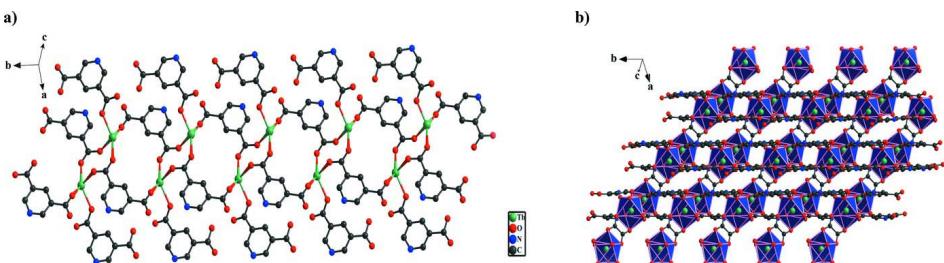

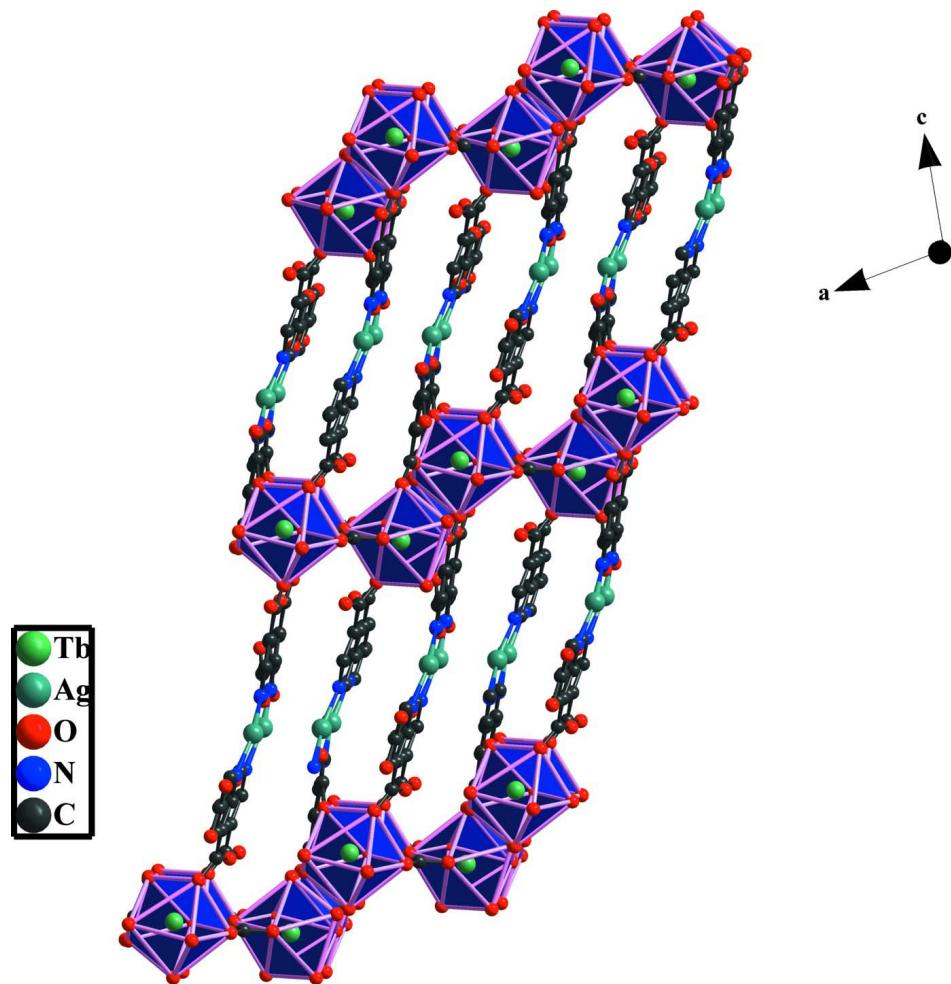

Figure 2
