Received 2 September 2009; accepted 5 September 2009

 Key indicators: single-crystal X-ray study; $T = 120$ K; mean $\sigma(C-C) = 0.002$ Å; R factor = 0.025; wR factor = 0.065; data-to-parameter ratio = 12.3.

In the title compound, $[\text{Ni}(\text{C}_{12}\text{H}_6\text{N}_2\text{O}_4)(\text{H}_2\text{O})_4]\cdot 2\text{H}_2\text{O}$, obtained from a basic solution of 2,2'-bipyridine-5,5'-dicarboxylate and nickel(II) chloride in water, the central Ni(II) cation (site symmetry 2) is coordinated by two N atoms from the 2,2'-bipyridine-5,5'-dicarboxylate ligand and four aqua O atoms. The N–Ni–N angle is $78.64(8)^\circ$. Weak but significant π – π stacking interactions exist between the pyridine rings with a centroid–centroid distance of $3.652(8)$ Å. In addition, four O atoms of the two carboxyl groups form hydrogen bonds with both coordinated and uncoordinated water molecules, forming an infinite three-dimensional network.

Tetraaqua(2,2'-bipyridine-5,5'-dicarboxylato- κ^2N,N')nickel(II) dihydrate

H. Yang

Comment

2,2'-Bipyridine was used very commonly as ending complexing ligand. Great efforts have been made to synthesize 5,5' and 6,6' position substituted derivatives (He *et al.*, 2009; Karaca *et al.*, 2009; Yousefi *et al.*, 2008). Here we reported the crystal structure of a complexing compound of Ni(II) coordinating to 4,4'-dicarboxyl substituted 2,2'-bipyridine derivative.

The central Ni cation coordinated to two N atoms from dianions of one 2,2'-bipyridine-5,5'-dicarboxylate and four O atoms from four waters, forming a distorted octahedral system. Ni(II) cation lies on the twofold axis of the crystal lattice. Two Ni—N bonds were generated by C₂ symmetry operation from each other with bond length 2.0706 (14). Four Ni—O bond lengths are nearly equal, two of which 2.0610 (12), and another two 2.0801 (13). Each of two equivalent carboxyl anions has two unequivalent oxygen atoms, C—O bond lengths of which are equalized to be 1.266 (2) and 1.254 (2), respectively. All O atoms of carboxyls formed hydrogen bonds with both complexed waters from another complexing supermolecule and free waters into three dimensional infinite hydrogen bonding network, which stabilized the whole crystal structure, along with pi-pi stacking of aromatic pyridine rings.

Experimental

A solution of 2,2'-bipyridine-5,5'-dicarboxylate (23.2 mg, 0.1 mmol) and NiCl₂·6H₂O (23.8 mg, 0.1 mmol) was added an aqueous solution of NaOH (0.1 mmol/ml) to adjust pH as 7.0–7.5 at room temperature. A small amount of white precipitate was removed from the resulting solution. Prism colorless crystals were obtained by slow evaporation at room temperature over a period of 10 days.

Refinement

All H atoms bonded to O atoms of ligand water and free water molecules were located in a difference map, and the distances of the O—H bonds were fixed to 0.82 Å. The other H atoms were placed in calculated positions and refined as riding, with C—H = 0.93 Å, and $U_{\text{iso}}(\text{H}) = 1.2 U_{\text{eq}}(\text{C})$.

Figures

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
