Received 8 September 2009; accepted 24 September 2009
Key indicators: single-crystal synchrotron study; $T=150 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.004 \AA$; H -atom completeness $72 \% ; R$ factor $=0.045 ; w R$ factor $=0.128$; data-to-parameter ratio $=13.9$.

The title compound, $\left\{\left[\mathrm{K}_{2}\left(\mathrm{C}_{12} \mathrm{H}_{6} \mathrm{~N}_{2} \mathrm{O}_{4}\right)\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}\right] \cdot 2 \mathrm{H}_{2} \mathrm{O}\right\}_{n}$, forms a three-dimensional coordination polymer in the solid state. The asymmetric unit consists of one $\mathrm{K}^{+}$ion, half of a $2,2^{\prime}$ -bipyridyl-5,5'-dicarboxylate ligand, one coordinated water molecule and one solvent water molecule. The $\mathrm{K}^{+}$ion is $7-$ coordinated by the oxygen atoms of two water molecules and by five oxygen atoms of four carboxylate groups, one of which is chelating. The extended structure can be described as a binodal network in which each $\mathrm{K}^{+}$is a six-connected node, bonding to four carboxylate groups and two bridging water molecules, and the 2,2'-bipyridyl-5,5'-dicarboxylate linkers are eight-connected nodes, with each carboxylate group bridging four metal centers. Overall, this arrangement generates a complex network with point symbol $\left\{3^{4} \cdot 4^{12} \cdot 5^{12}\right\}\left\{3^{4} \cdot 4^{4} \cdot 5^{4} \cdot 6^{3}\right\}_{2}$. Both of the bridging water molecules participate as donors in hydrogen-bonding interactions; one to solvent water molecules and a second to an oxygen atom of a carboxylate group.

## Related literature

For topological analysis, see: Blatov (2007). For background to metal-organic frameworks (MOFs), see: MacDougall et al. (2005). The 2,2'-bipyridyl-5,5'-dicarboxylate ligand has been used as a linear linker for a variety of MOFs, see: Finn \& Zubieta, (2002); Schoknecht \& Kempe (2004); Szeto et al., (2008). It is a particularly interesting linker due to the fact that the pyridyl N atoms have the ability to act as Lewis bases for binding metal centers (Szeto et al., 2008). There has been only one structural example of this ligand bound to an alkali metal reported, viz. Rb (Hafizovic et al., 2007). For synthetic details, see: Anderson et al. (1985).

# Synchrotron study of poly[[di- $\mu$-aqua ( $\mu$-2,2'-bipyridyl-5,5'-dicarboxylato)dipotassium] dihydrate] 

Jeffrey A. Bertke, Allen G. Oliver and Kenneth W. Henderson

## S1. Comment

We are interested in using pre-assembled and structurally well defined aggregates as secondary building units (SBUs) to build coordination polymers or metal-organic frameworks (MOFs) (MacDougall et al., 2005). The title compound was synthesized as a precursor for use as a linker in the construction of MOFs. The $2,2^{\prime}$-bipyridyl- $5,5^{\prime}$-dicarboxylate ligand has been used as a linear linker for a variety of MOFs (Finn \& Zubieta, 2002; Schoknecht \& Kempe, 2004); Szeto et al., 2008). It is a particularly interesting linker due to the fact that the pyridyl N atoms have the ability to act as Lewis bases for binding metal centers (Szeto et al., 2008).
The asymmetric unit consists of one $\mathrm{K}^{+}$ion, half of a 2, $2^{\prime}$-bipyridyl- $5,5^{\prime}$-dicarboxylate ligand, one coordinated water molecule and one solvent water molecule (Fig. 1). The extended crystal structure of the title compound is composed of two-dimensional sheets consisting of potassium-carboxylate and potassium-water interactions. These sheets extend parallel to ( 001 ). The three-dimensional assembly is completed by connection of the sheets through the $2,2^{\prime}$-bipyridyl linkers (Fig. 2). Small channels run along the $a$ axis and contain the disordered solvent water molecules. The geometry around the seven-coordinate potassium metal center can be described as a distorted monocapped trigonal-prism. The faces deviate from the ideal triangular, with angles of $49.69^{\circ}(\mathrm{O} 1-\mathrm{O} 3-\mathrm{O} 2), 61.19^{\circ}(\mathrm{O} 2-\mathrm{O} 1-\mathrm{O} 3)$ and $69.10^{\circ}(\mathrm{O} 1-$ $\mathrm{O} 2-\mathrm{O} 3)$. There is also a short contact distance of 2.826 (6) $\AA$ between O 4 and N 1 , which is most likely due to a hydrogen bonding interaction. However, the hydrogen atoms on the solvent water molecule could not be located in the difference map.
For the topological analysis of the structure, the program TOPOS was used (Blatov, 2007). There has been only one structural example of the 2,2'-bipyridyl-5,5'-dicarboxylate ligand bound to an alkali metal reported, viz. Rb (Hafizovic et al., 2007).

## S2. Experimental

The title complex was prepared using a modification of the method of Seddon and Pilling (Anderson et al., 1985) for the preparation of $2,2^{\prime}$-bipyridyl-4,4'-dicarboxylic acid. 5,5'-dimethyl-2, $2^{\prime}$-bipyridine and $\mathrm{K}\left[\mathrm{MnO}_{4}\right]$ were purchased from Aldrich and used without further purification. ${ }^{1} \mathrm{H}$ NMR data were collected on a Varian Unity Plus 300 spectrometer at $298 \mathrm{~K} . \mathrm{K}\left[\mathrm{MnO}_{4}\right](10 \mathrm{~g}, 63 \mathrm{mmol})$ was added to a solution of $5,5^{\prime}$-dimethyl-2, $2^{\prime}$-bipyridine ( $1.6 \mathrm{~g}, 8.7 \mathrm{mmol}$ ) in 100 mL $\mathrm{H}_{2} \mathrm{O}$. The mixture was heated to reflux for 12 h . Upon cooling, the mixture was filtered and the black precipitate was washed with water ( $2 \times 30 \mathrm{~mL}$ ). The filtrate and the washings were combined and extracted with diethyl ether to remove unreacted starting material. The aqueous fraction was collected and the solvent was removed under vacuum, leaving a sticky white solid. The solid was heated under vacuum at 373 K overnight to give a fine white powder. Single crystals were grown from an aqueous solution upon slow evaporation of the solvent.

## S3. Refinement

Hydrogen atoms were placed at calculated positions and allowed to ride on the position of the parent atom, with the exception of those on the coordinated O3 water molecule which were located in the difference fourier map. H atoms of the uncoordinated water molecule O 4 could not be located unambiguously and were eventually excluded from the refinement.

Figure 1
A portion of the polymeric structure of the title compound. All hydrogen atoms except those located on O 3 have been omitted. Thermal ellipsoids are shown at the $50 \%$ probablility level.

Figure 2
Thermal ellipsoid plot of the asymmetric unit of the title compound. Thermal ellipsoids are shown at the $50 \%$ probablility level.

## Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving 1.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors(gt) etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
