

# Dicyclohexyl(2',4',6'-triisopropylbiphenyl-2-yl)phosphine–dichlorophenylborane

Holger Braunschweig,\* Rian D. Dewhurst, Krzysztof Radacki and Katharina Wagner

Institut für Anorganische Chemie, Universität Würzburg, Am Hubland, D-97074 Würzburg, Germany

Correspondence e-mail: H.Braunschweig@mail.uni-wuerzburg.de

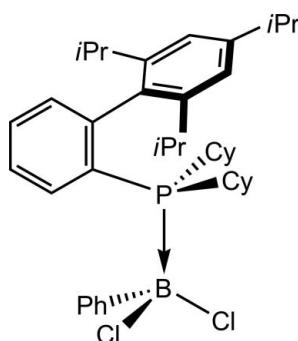

Received 9 October 2009; accepted 13 October 2009

Key indicators: single-crystal X-ray study;  $T = 100\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.002\text{ \AA}$ ;  $R$  factor = 0.036;  $wR$  factor = 0.088; data-to-parameter ratio = 27.0.

In the crystal structure of the title compound,  $\text{C}_{39}\text{H}_{54}\text{BCl}_2\text{P}$ , the phosphorus atom is coordinated by a dichlorophenylborane unit. The substituted biphenyl group and the two cyclohexyl groups at the phosphorus atom are arranged in such a way to avoid steric crowding in the molecule as far as possible.

## Dicyclohexyl(2',4',6'-triisopropylbiphenyl-2-yl)phosphine–dichlorophenylborane

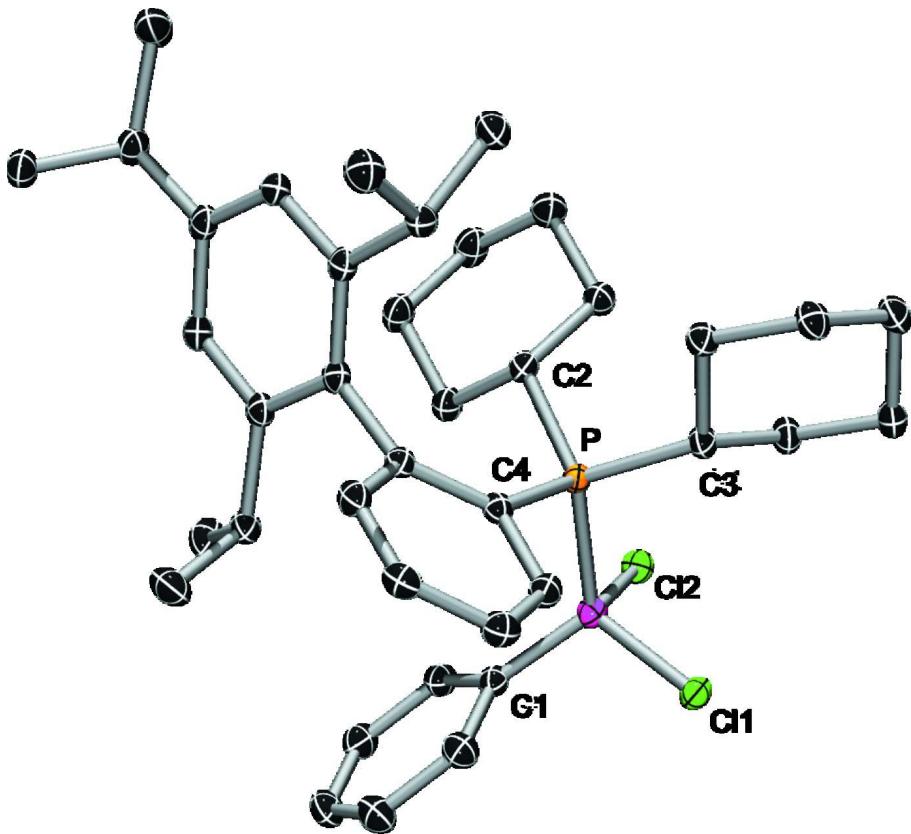

**Holger Braunschweig, Rian D. Dewhurst, Krzysztof Radacki and Katharina Wagner**

### S1. Comment

The title compound, previously not known in the literature, was prepared by the reaction of dichlorophenylborane with 2-dicyclohexylphosphino-2',4',6'-triisopropylbiphenyl. The second precursor is also known as XPhos and is used for example in Pd-catalysed C–N bond-forming processes (Strieter *et al.*, 2003). There is one similar structurally characterized compound ( $\text{PhMe}_2\text{PBCl}_3$ ), which is a byproduct in the reaction of a platinum boryl complex with phosphine (Charmant *et al.*, 2007). However in this molecule there is no biphenyl ring attached to the phosphorus atom. The compound (2-biphenylyl)methoxyphenylphosphine-P-borane(1/1) which is used by Grabulosa *et al.* (2005) in the asymmetric hydrovinylation of styrene, contains a biphenyl ring but has no halogens at the boron. Beyond that this biphenyl ring is not substituted by isopropyl groups. So the choice of the substituents in the title compound makes it different from currently known compounds, in that the biphenylphosphines so far have not been combined with reactive haloboranes. The P–B distance is comparable with that found in  $\text{PhMe}_2\text{P}=\text{BCl}_3$  (Charmant *et al.*, 2007) and in  $\text{BiphMePhP}=\text{BH}_3$  (Biph = Ph-2-Ph) (Grabulosa *et al.*, 2005). The B–Cl distance is comparable with those found in  $\text{PhMe}_2\text{PBCl}_3$  (Grabulosa *et al.*, 2005). The biphenyl substituent is positioned away from the boron so that the isopropyl groups have sufficient space. The two phenyl rings of the biphenyl group adopt an almost perpendicular position to each other, as is the typical conformation. The boron centre displays a slightly disordered tetrahedral coordination.

### S2. Experimental

To prepare the title compound, 2-(dicyclohexylphosphino)-2',4',6'-triisopropylbiphenyl (0.20 g, 0.42 mmol) dissolved in 2 ml benzene, and dichlorophenylborane (0.07 g, 0.46 mmol) dissolved in 2 ml benzene were combined and stirred for 3 h at ambient temperature. All volatiles were removed under reduced pressure. The obtained solid was washed twice with 4 ml hexane. Recrystallization at ambient temperature from hexane gave colourless crystals of (I) 0.11 g (0.23 mmol, 54%).

**Figure 1**

The molecular structure of (I). Displacement ellipsoids are drawn at the 50% probability level and H atoms have been omitted.

where  $P = (F_o^2 + 2F_c^2)/3$  $(\Delta/\sigma)_{\text{max}} = 0.003$  $\Delta\rho_{\text{max}} = 0.53 \text{ e } \text{\AA}^{-3}$  $\Delta\rho_{\text{min}} = -0.33 \text{ e } \text{\AA}^{-3}$ *Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
