Received 9 October 2009; accepted 12 October 2009
Key indicators: single-crystal X-ray study; $T=100 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.002 \AA$; $R$ factor $=0.026 ; w R$ factor $=0.068$; data-to-parameter ratio $=12.6$.

The title compound, $\mathrm{C}_{9} \mathrm{H}_{10} \mathrm{~N}_{2} \mathrm{O}_{2} \mathrm{~S}$, was obtained from the treatment of ethyl 4-cyano-3-hydroxy-5-morpholinothio-phene-2-carboxylate with concentrated HCl . The mean plane of the essentially planar dihydrothiophene ring is almost orthogonal to the mirror plane of the $N$-morpholine substituent, making a dihedral angle of $87.2(2)^{\circ}$.

## Related literature

For the structure of a similar compound with the morpholine substituent attached to dihydrothiophene ring, see: Moghaddam et al. (2005).

## 2-Morpholino-4-oxo-4,5-dihydrothiophene-3-carbonitrile

JinJiang Zhu, Kevin K. Liu, Matthew A. Marx, Arnold L. Rheingold and Alex Yanovsky

## S1. Comment

The title compound was obtained via the treatment of ethyl 4-cyano-3-hydroxy-5-morpholinothiophene-2-carboxylate with concentrated HCl , and its structural formula was confirmed by the present study (Fig. 1).
Dihydrothiophene ring $\mathrm{C} 5 / \mathrm{C} 6 / \mathrm{C} 7 / \mathrm{C} 8 / \mathrm{S} 1$ is planar within $0.02 \AA$. Its least squares plane is almost orthogonal to the mirror plane of the $N$-morpholine substituent passing through $\mathrm{C} 5, \mathrm{~N} 1$ and O 1 atoms: the corresponding dihedral angle being $92.8(2)^{\circ}$. Similar conformation is observed in the related structure with morpholine substituent attached to dihydrothiophene ring (Moghaddam et al., 2005).

## S2. Experimental

Into a suspension of ethyl 4-cyano-3-hydroxy-5-morpholinothiophene-2-carboxylate ( $100 \mathrm{mg}, 0.35 \mathrm{mmol}$ ) in MeOH ( 1.2 $\mathrm{ml})$, was added concentrated $\mathrm{HCl}(0.2 \mathrm{ml})$ with stirring. The reaction mixture was heated in an oil bath at $60^{\circ} \mathrm{C}$ for 48 h to form a clear solution. The reaction solution was cooled to room temperature and the solvent was removed under reduced pressure. The resulting residue was neutralized with 2 N NaOH to pH 4 . The precipitate was collected by filtration and rinsed with a solution of water $/ \mathrm{MeOH}$. The sample was dried under high vacuum to afford the desired compound as a white solid ( $52.1 \mathrm{mg}, 58 \%$ yield). LC—MS (APCI, M+1) $211.2 ;{ }^{1} \mathrm{H}$ NMR ( 300 MHz, DMSO-d ${ }_{6}$ ) $\delta$ p.p.m. 3.87 (s, 3 H ), $3.84(\mathrm{dd}, \mathrm{J}=5.84,2.07 \mathrm{~Hz}, 2 \mathrm{H}), 3.68-3.79(\mathrm{~m}, 5 \mathrm{H})$. The product was recrystallized from EtOAc/hexane/dichloromethane to yield single crystals suitable for X-ray diffraction studies.

## S3. Refinement

All H atoms were placed in geometrically calculated positions ( $\mathrm{C}-\mathrm{H} 0.99 \AA$ ) and included in the refinement in riding motion approximation. The $U_{\text {iso }}(\mathrm{H})$ were set to $1.2 U_{\text {eq }}$ of the carrying atom.

Figure 1
Molecular structure of the title compound, showing $50 \%$ probability displacement ellipsoids and atom numbering scheme. H atoms are drawn as circles with arbitrary small radius.

> $(\Delta / \sigma)_{\max }=0.005$
> $\Delta \rho_{\max }=0.29 \mathrm{e} \AA^{-3}$
> $\Delta \rho_{\min }=-0.20$ e $\AA^{-3}$
> Extinction correction: $S H E L X L 97($ Sheldrick, $\quad 2008), \mathrm{Fc}^{*}=\mathrm{kFc}\left[1+0.001 \mathrm{xFc}^{2} \lambda^{3} / \sin (2 \theta)\right]^{-1 / 4}$
> Extinction coefficient: $0.0051(4)$

## Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two 1.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors $(\mathrm{gt})$ etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
