Received 13 August 2009; accepted 9 October 2009

Key indicators: single-crystal X-ray study; $T = 293\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.004\text{ \AA}$;
 R factor = 0.036; wR factor = 0.107; data-to-parameter ratio = 11.8.

The title compound, $[\text{Ni}(\text{C}_{11}\text{H}_6\text{N}_2\text{O})(\text{H}_2\text{O})_4](\text{NO}_3)_2$, was prepared by the reaction of $\text{Ni}(\text{NO}_3)_2$ and 4,5-diazafluoren-9-one (dafo). The crystal packing consists of a three-dimensional network via $\text{O}-\text{H}\cdots\text{O}$ hydrogen bonds between the coordinated water molecules and the nitrate anions. The Ni atom lies on a special position (Wyckoff position $4e$, site symmetry 2), as does the carbonyl O atom.

Tetraaqua(4,5-diazafluoren-9-one- κ^2N,N')nickel(II) dinitrate

Meng Guo

S1. Comment

4,5-diazafluoren-9-one (dafo), as well as the modified 1,10-phenanthroline (phen) neutral ligand, have allured interest in electrochemical, DNA intercalation and biological properties (Prasad *et al.*, 2002 & Prasad *et al.*, 2001). Because of the larger bite distance (2.99 Å) between two coordination nitrogen atoms, dafo provides an uncommon coordination environment, yielding a number of coordination compounds, such as two-dimensional sheets of [(dafone)₂Cu(NCS)]_n (Prasad *et al.*, 2002), the zigzag chain structure of [Cu(Hnta)(afo)] (nta=nitrilotriacetate) (Li *et al.*, 2003), the helical chains of cations formed by π - π stacking interaction in [Cd(dafo)₂(tphpo)(CH₃COO)]ClO₄ (tphpo=triphenylphosphine oxide) (Wu *et al.*, 2003), [Cu(dafone)₂Cl₂(dafoneH⁺H₂O)₂(ClO₄)₂] (Prasad *et al.*, 2001) and [Zn(C₁₁H₆N₂O)₂(H₂O)₂](NO₃)₂ (Zhang *et al.*, 2003). Compared to phen and 2,2'-bipyridine, the number of characterised metal compounds with dafo ligand is still small. Here we report the synthesis and structure of the title compound, which forms a three-dimensional network by O—H \cdots O bonding.

The title structure (Fig. 1) features one Ni atom on a special position (Wyckoff position 4e, site symmetry 2), one 4,5-diazafluoren-9-one (dafo) ligand, four coordination water molecules and two nitrate anion. Even the dafo ligand lies on a special position (Wyckoff position 4e, site symmetry 2 with the C=O bond containing the twofold axis). Ni is coordinated by the two N atoms from dafo ligand, and four water molecules, yielding an overall tetragonally distorted octahedral geometry. The nitrogen donor atoms and two coordinated water molecules are found in the equatorial plane while the remaining two water molecules occupy the axial positions. The mean Ni—N and Ni—O bond lengths are similar to the reported (Swamy *et al.*, 2001, Kramer *et al.*, 2002). The torsion angles of O1W—Ni1—N2—C1, O2W—Ni1—N2—C1 are -91.30 (2) and -3.40 (2) $^\circ$, respectively.

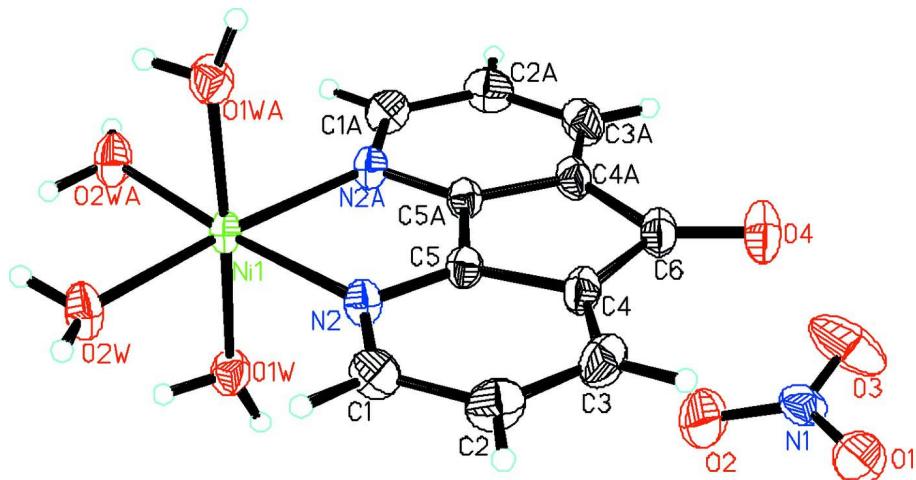

Hydrogen bonds are formed between the water molecules and O atoms from nitrate anions and the carbonyl group of the dafo ligand. O2w \cdots O4 hydrogen-bond interactions link neighboring cations and form the one-dimensional chains. The anion NO₃⁻ link these chains together by O1w \cdots O and O2w \cdots O hydrogen bonds, resulting in the three-dimensional network (Fig.2).

S2. Experimental

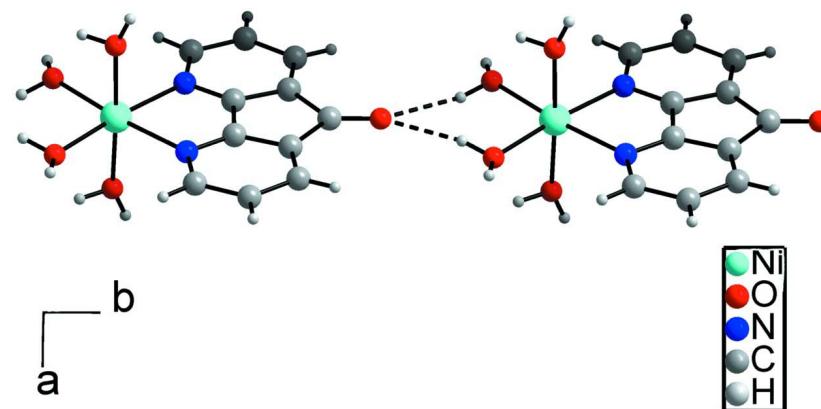

All commercially obtained reagent-grade chemicals were used without further purification. To a solution of dafo (0.452 g, 2.5 mmol) in methanol solution (30 ml) was added Ni(NO₃)₂ 6(H₂O) (0.581 g, 2.0 mmol) in water (20 ml). The solution was stirred for 1.5 h. The resultant dark green precipitate was filtered and dried thoroughly in air. The green crystals (yield 0.79 g) were grown by slow evaporation from the water and methanol (2:3 v/v) mixed solution.

S3. Refinement

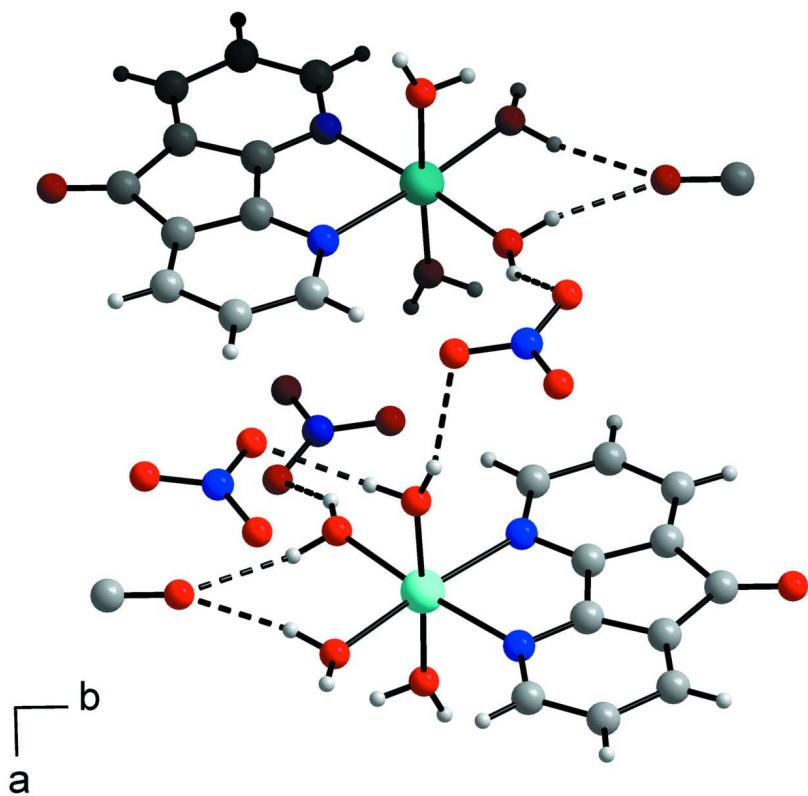

H atoms were positioned geometrically and allowed to ride on their parent atoms, with C—H and O—H distances of 0.93 and 0.85 Å, respectively, and with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}$ of the parent atoms.

**Figure 1**

The molecular structure of the title compound with the atom-labeling scheme. Displacement ellipsoids are drawn at the 30% probability level.

**Figure 2**

The chains formed by direct O(water)-H...O(carbonyl). H bonds as dashed lines

**Figure 3**

The network formed by O–H···ONO₂ hydrogen bonds. H bonds as dashed lines. Only the C=O groups from the dafo ligand in the upper right and lower left corner are shown.

 $(\Delta/\sigma)_{\text{max}} < 0.001$
 $\Delta\rho_{\text{max}} = 0.46 \text{ e } \text{\AA}^{-3}$
 $\Delta\rho_{\text{min}} = -0.60 \text{ e } \text{\AA}^{-3}$

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
