Received 16 October 2009; accepted 22 October 2009

Key indicators: single-crystal X-ray study; $T=296 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.005 \AA$; $R$ factor $=0.024 ; w R$ factor $=0.068$; data-to-parameter ratio $=20.9$.

In the title compound, $\left[\mathrm{ZnBr}_{2}\left(\mathrm{C}_{6} \mathrm{H}_{7} \mathrm{~N}\right)_{2}\right]$, the Zn atom (site symmetry 2) adopts a distorted tetrahedral $\mathrm{ZnN}_{2} \mathrm{Br}_{2}$ geometry. In the crystal, molecules are linked by $\mathrm{N}-\mathrm{H} \cdots \mathrm{Br}$ hydrogen bonds, generating sheets containing $R_{2}^{2}(8)$ loops.

## Dianilinedibromidozinc(II)

Ejaz, Onur Sahin and Islam Ullah Khan

## S1. Comment

Researches have worked on synthesis and X-ray studies of organo-zinc complexes for their applications in catalysis (Ibrahim et al., 2003, Park et al., 2008) and supramolecular chemistry (Nesterova et al., 2005). These complexes act as fluorescent probe for labeling proteins (Wu et al., 2008). Herein, we report the synthesis and crystal structure of the title compound, (I).
The molecular structure of $(\mathrm{I})$ is presented in Fig. 1. The compound crystallizes in the space group $C 2 / c$ with $Z^{\prime}=1 / 2$. The $\mathrm{Zn}^{\text {II }}$ ion is located on a 2-fold axis and is coordinated by two Br atoms $\left[\mathrm{Zn} 1-\mathrm{Br} / \mathrm{Br} 1^{\mathrm{iii}}=2.3851\right.$ (3) $\AA$ ] and two amino N atoms from aniline ligands $\left[\mathrm{Zn} 1-\mathrm{N} 1 / \mathrm{N} 1^{\text {iii }}=2.057\right.$ (2) $\AA$ ] [symmetry code: (iii) $\left.1-x, y, 3 / 2-z\right]$. The geometry around the $\mathrm{Zn}^{\text {II }}$ ion is that of a tetrahedron. The benzene ring plane is approximately planar, with maximum deviation from the least-squares plane being 0.004 (2) $\AA$ for atom C2.
Molecules of the title compound are linked in to shetts by a combination of $\mathrm{N}-\mathrm{H} \cdots \mathrm{Br}$ hydrogen bonds (Table 1).
Amino atom N 1 in the reference molecule at $(x, y, z)$ acts as hydrogen-bond donor, via H 2 A , respectively, to atom Br 1 in the molecule at $(x, y-1, z)$, so forming a $C(4)\left[R_{2}{ }^{2}(8)\right]$ (Bernstein et al., 1995) chain of rings running parallel to the [010] direction (Fig. 2). Similarly, amino atom N1 in the reference molecule at ( $x, y, z$ ) acts as hydrogen-bond donor, via H1A, respectively, to atom Br 1 in the molecule at $(x,-y, z-1 / 2)$, so forming a $C(4)\left[R_{2}{ }^{2}(8)\right]$ chain of rings running parallel to the [001] direction and centrosymmetric $R_{2}{ }^{2}(8)$ ring centred at (1/2, 0, 1/2) (Fig. 3).

## S2. Experimental

Zinc bromide ( $1.125 \mathrm{~g}, 5 \mathrm{mmol}$ ) was added to distilled water ( 20 ml ). Aniline ( $0.93 \mathrm{~g}, 10 \mathrm{mmol}$ ) was added to the above solution and stirred at room temperature for 5 minutes. White precipitate formed was filtered off, washed with distilled water, dried and recrystallized in methanol to yield colourless blocks of (I).

## S3. Refinement

All C-bonded H atoms were refined using a riding model, with $\mathrm{C}-\mathrm{H}$ distances constrained to $0.93 \AA$ and with $U_{\mathrm{iso}}=$ $1.2 U_{\mathrm{eq}}(\mathrm{C})$. Amino H atoms were located in difference map and refined freely.

Figure 1
The molecular structure of (I), showing displacement ellipsoids drawn at the $30 \%$ probability level. [Symmety code: (iii) $1-x, y, 3 / 2-z$.]

Figure 2
Part of the crystal structure of the title compound, showing the formation of an $R_{2}{ }^{2}(8)$ dimer along [010].

Figure 3
Part of the crystal structure of the title compound, showing the formation of an $R_{2}{ }^{2}(8)$ dimer along [001]. Hydrogen bonds are indicated by dashed lines. H atoms not involved in these interactions have been omitted for clarity. (Symmetry codes as in Table 1.)

## Refinement

Refinement on $F^{2}$
Least-squares matrix: full
$R\left[F^{2}>2 \sigma\left(F^{2}\right)\right]=0.024$
$w R\left(F^{2}\right)=0.068$
$S=1.18$
1796 reflections
86 parameters
0 restraints
Primary atom site location: structure-invariant direct methods

> Secondary atom site location: difference Fourier map
> Hydrogen site location: inferred from $\quad$ neighbouring sites
> H atoms treated by a mixture of independent $\quad$ and constrained refinement
> $w=1 /\left[\sigma^{2}\left(F_{0}^{2}\right)+(0.035 P)^{2}\right]$
> where $P=\left(F_{0}^{2}+2 F_{\mathrm{c}}^{2}\right) / 3$
> $(\Delta / \sigma)_{\max }=0.001$
> $\Delta \rho_{\max }=0.36$ e $\AA^{-3}$
> $\Delta \rho_{\min }=-0.60 \mathrm{e}^{-3}$

## Special details

1489 reflections with $I>2 \sigma(I)$
$R_{\text {int }}=0.026$
$\theta_{\text {max }}=28.3^{\circ}, \theta_{\text {min }}=1.7^{\circ}$
$h=-34 \rightarrow 32$
$k=-4 \rightarrow 6$
$l=-16 \rightarrow 16$

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two 1.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors $(\mathrm{gt})$ etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
