Received 17 October 2009; accepted 18 October 2009
Key indicators: single-crystal X-ray study; $T=296 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.003 \AA$; $R$ factor $=0.044 ; w R$ factor $=0.148$; data-to-parameter ratio $=17.8$.

In the title compound, $\mathrm{C}_{9} \mathrm{H}_{9} \mathrm{FN}_{2} \mathrm{O}$, the dihedral angle between the fluorobenzene ring and the mean plane of the side chain is 15.59 (14) ${ }^{\circ}$. In the crystal, the molecules form inversion dimers linked by pairs of $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds, resulting in $R_{2}^{2}(8)$ loops. These dimers are reinforced by $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ interactions.

## S1. Comment

Recently we have reported the crystal structures of (II) $N^{\prime \prime}-[(1 E)-1-(4-C h l o r o p h e n y l) e t h y l i d e n e]$ formohydrazide (Shafiq et al., 2009a), (III) $N^{\prime}-[(E)-(5-M e t h y l f u r a n-2-y l) m e t h y l i d e n e] f o r m o h y d r a z i d e ~(S h a f i q ~ e t ~ a l ., ~ 2009 b) . ~ T h e ~ t i t l e ~ c o m p o u n d ~(I, ~$
Fig. 1) has been prepared in continuation of synthesizing various formohydrazide derivatives.
In (I), the groups $A(C 1-C 6 / F 1)$ and $B(C 7 / C 8 / N 1 / N 2 / C 9)$ are planar with maximum r. m. s. deviations of 0.0022 and $0.0146 \AA$, respectively from their mean squares planes. The dihedral angle between $\mathrm{A} / \mathrm{B}$ is $15.59(14)^{\circ}$.
The molecules of (I) consist of dimers similar to (II) and (III) due to $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ type of intermolecular H -bondings forming $R_{2}{ }^{2}(8)$ ring motifs (Bernstein et al., 1995). The difference between (I) and (II) is the substitution of Cl and F -atom on the para and meta positions of benzene ring, respectively. Due to this change there exist two $R_{2}{ }^{1}(7)$ ring motifs in dimers due to $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ and $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ H-bondings (Table 1).

## S2. Experimental

To a hot stirred solution of formic hydrazide $(1.0 \mathrm{~g}, 0.017 \mathrm{~mol})$ in ethanol $(15 \mathrm{ml})$ was added 1-(3-fluorophenyl)ethanone $(2.043 \mathrm{ml}, 0.017 \mathrm{~mol})$. The resultant mixture was then heated under reflux. The reaction mixture was refluxed about 12 h and monitored through TLC. After the completion of reaction, the mixture was cooled to room temperature. The solid was collected by suction filtration. The product obtained was washed with hot ethanol and 1,4-dioxan and dried.
Colourless needles of (I) were obtained by recrystallization of the crude product in 1,4-dioxan after two days.

## S3. Refinement

The H-atoms were positioned geometrically ( $\mathrm{N}-\mathrm{H}=0.86 \AA, \mathrm{C}-\mathrm{H}=0.93-0.96 \AA$ ) and refined as riding with $U_{\text {iso }}(\mathrm{H})=$ $1.2 U_{\mathrm{eq}}$ (carrier) or $1.5 U_{\mathrm{eq}}$ (methyl C).

Figure 1
View of (I) with displacement ellipsoids drawn at the $50 \%$ probability level. H-atoms are shown by circles of arbitrary radius.

Figure 2
The partial packing of (I), which shows that molecules form dimers.

$\Delta \rho_{\max }=0.23 \mathrm{e} \AA^{-3}$
$\Delta \rho_{\text {min }}=-0.20$ e $\AA^{-3}$

## Special details

Geometry. Bond distances, angles etc. have been calculated using the rounded fractional coordinates. All su's are estimated from the variances of the (full) variance-covariance matrix. The cell e.s.d.'s are taken into account in the estimation of distances, angles and torsion angles
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors (gt) etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
