Correspondence e-mail: ffjian2008@163.com

Received 22 October 2009; accepted 28 October 2009

Key indicators: single-crystal X-ray study; $T=293 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.006 \AA$; $R$ factor $=0.056 ; w R$ factor $=0.170$; data-to-parameter ratio $=10.4$.

In the title compound, $\mathrm{C}_{16} \mathrm{H}_{10} \mathrm{O}_{6}$, the complete molecule is generated by a crystallographic centre of symmetry. In the crystal, $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds link the molecules into (100) sheets and $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ links also occur.

## S1. Comment

Substituted phthalides (isobenzofuran-1 $(3 H)$-ones) represent an important class of natural products that posses significant biological properties (e.g. Pedrosa et al., 2006). As part of our search for new biologically active compounds, we unexpected obtained the title compound, (I), which is a typical derivative of phthalides.
In the crystal structure of compound (I) (Fig. 1),there is an inversion center, which is located at the mid-point of C(8)$\mathrm{C}(8 \mathrm{~A})$ bond. All of the bond lengths and bond angles are in the normal ranges (Wang et al., 2001). In the crystal lattice, there are a $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ intramolecular hydrogen bond and an $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ intermolecular hydrogen bond, which stabilize the molecule structure.

## S2. Experimental

Phthalic anhydride ( 0.05 mol ) was dissolved in dichloromethane $(100 \mathrm{ml})$. Then, $\mathrm{AlCl}_{3}(0.05 \mathrm{~mol})$ was added. The mixture was stirred at room temperature and the whole reaction was under the protection of nitrogen. After 5 h , the reaction was stopped and the mixture poured into ice-water. The organic layer was collected and then was dried with $\mathrm{MgSO}_{4}$. Finally, the organic layer was concentrated by rotary vacuum evaporation to obtain yellow solids. Yellow blocks of (I) were obtailed by recrystallization from acetonitrile at room temperature.

## S3. Refinement

The H atoms were located in difference maps and freely refined.

Figure 1
The molecular structure of (I) with displacement ellipsoids drawn at the $30 \%$ probability level.

## Refinement

Refinement on $F^{2}$
Least-squares matrix: full
$R\left[F^{2}>2 \sigma\left(F^{2}\right)\right]=0.056$
$w R\left(F^{2}\right)=0.170$
$S=1.02$
1263 reflections
121 parameters
0 restraints
Primary atom site location: structure-invariant direct methods
Secondary atom site location: difference Fourier map
$F(000)=308$
$D_{\mathrm{x}}=1.523 \mathrm{Mg} \mathrm{m}^{-3}$
Mo $K \alpha$ radiation, $\lambda=0.71073 \AA$
Cell parameters from 1978 reflections
$\theta=3.5-27.5^{\circ}$
$\mu=0.12 \mathrm{~mm}^{-1}$
$T=293 \mathrm{~K}$
Block, yellow
$0.16 \times 0.12 \times 0.10 \mathrm{~mm}$

622 reflections with $I>2 \sigma(I)$
$R_{\text {int }}=0.070$
$\theta_{\text {max }}=25.9^{\circ}, \theta_{\text {min }}=2.7^{\circ}$
$h=0 \rightarrow 9$
$k=-9 \rightarrow 0$
$l=-13 \rightarrow 12$

Hydrogen site location: inferred from neighbouring sites
H atoms treated by a mixture of independent and constrained refinement
$w=1 /\left[\sigma^{2}\left(F_{\mathrm{o}}{ }^{2}\right)+(0.0846 P)^{2}\right]$
where $P=\left(F_{\mathrm{o}}^{2}+2 F_{\mathrm{c}}^{2}\right) / 3$
$(\Delta / \sigma)_{\text {max }}<0.001$
$\Delta \rho_{\text {max }}=0.29 \mathrm{e}^{-3}$
$\Delta \rho_{\text {min }}=-0.30$ e $\AA^{-3}$
Extinction correction: SHELXL97 (Sheldrick, 2008), $\mathrm{Fc}^{*}=\mathrm{kFc}\left[1+0.001 \mathrm{xFc}^{2} \lambda^{3} / \sin (2 \theta)\right]^{-1 / 4}$

Extinction coefficient: 0.032 (10)

## Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two 1.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors $(\mathrm{gt})$ etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
