Correspondence e-mail: helghamrymo@yahoo.com

Received 2 October 2009; accepted 12 October 2009

Key indicators: single-crystal X-ray study; $T=100 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.002 \AA$; $R$ factor $=0.016 ; w R$ factor $=0.040 ;$ data-to-parameter ratio $=16.7$.

In the title compound, $\left[\mathrm{CoBr}_{2}\left(\mathrm{C}_{14} \mathrm{H}_{24} \mathrm{~N}_{4}\right)\right] \cdot \mathrm{Br}$, the $\mathrm{Co}^{\mathrm{III}}$ ion is located on an inversion centre and possesses a distorted octahedral coordination geometry in which four nitrogen donors of the ligand molecule are in the equatorial plane and two $\mathrm{Br}^{-}$ions occupy both the axial sites to give a trans isomer. The $\mathrm{Br}^{-}$counter- anion is also located on an inversion centre.

## S1. Comment

Most of the known synthetic macrocyclic ligands and their metal complexes have been prepared and characterized during the last few decades. Most commonly they are quadridentates containing nitrogen donor atoms, although compounds containing oxygen and sulfur donors are also known (Douglas, 1978). Metal template synthesis of multidentate and macromonocyclic ligands have been established over the last three decades as offering high yield and selective routes to new ligands and their complexes (Comba et al., 1986). Transition metal macrocyclic complexes have received much attention as active part of metalloenzymes (Chaudhary et al., 2002) as biomimic model compounds (Jones et al., 1979) due to their resemblance with natural proteins like hemerythrin and enzymes. They also played an important role as catalysts in oxidation and epoxidation processes (Chandra et al., 2008). There are some recent reports about some macrocyclic $\mathrm{Co}^{\mathrm{II}}$ and $\mathrm{Co}^{\mathrm{III}}$ complexes which showed high activity towards $\mathrm{H}_{2}$ evolution electrochemically (Hu et al., 2007) or photochemically (Fihri, Artero, Pereira \& Fontecave, 2008; Fihri, Artero, Razavet et al., 2008; Du et al., 2008). The title compound has been observed to evolve $\mathrm{H}_{2}$ electrocatalytically in acetonitrile (Hu et al., 2007). Unfortunately, it is found that this compound does not show any catalytic activity towards $\mathrm{H}_{2}$ evolution in a well known photosystem consisting of tris ( $2,2^{\prime}$-bipyridine)ruthenium(II) as a photosensitizer, methylviologen ( $N, N^{\prime}$-dimethyl-4, $4^{\prime}$-bipyridinium) as an electron mediator, and ethylenediaminetetraacetic acid disodium salt as a sacrificial electron donor. Because of our ongoing studies on the $\mathrm{H}_{2}$-evolving activity of $\mathrm{Pt}^{\mathrm{II}}$ based molecular catalysts (Yamauchi et al., 2009), attempts have been made to obtain the $\mathrm{Pt}^{t I}$ complex of the present macrocyclic ligand. However the metal exchange from $\mathrm{Co}^{\text {III }}$ to $\mathrm{Pt}^{\text {II }}$ has been unsuccessful so far, presunably due to the extremely high stability of the $\mathrm{Co}^{\text {III }}$ complex, during the course of these studies we have succeeded in the $x$-ray crystal structure determination of the present compound.
The $\mathrm{Co}^{\text {III }}$ ion and the $\mathrm{Br}^{-}$ion involved as a counter anion are respectively located at crystallographic inversion centers. Because of these requirements four nitrogen donors, two of them are independent, comprise a crystalloaphically planar geometry and the $\mathrm{Co}^{\text {III }}$ ion is also located exactly on the same plane. The vector defined by the $\mathrm{Co}-\mathrm{Br}$ bond is slightly declined from the vector which is peependicular to the basal plane consisting of the four nitrogen donor atoms which can be recognized from the $\mathrm{N}-\mathrm{Co}-\mathrm{Br}$ angles; $\left[\mathrm{N} 2 — \mathrm{Co1}-\mathrm{Br} 1=91.78(4)^{\circ}\right.$ and $\left.\mathrm{N} 1 — \mathrm{Co} 1 — \mathrm{Br} 1=89.14(4)^{\circ}\right]$. It is also observed that the $\mathrm{Co}-\mathrm{N}, \mathrm{N}=\mathrm{C}$ and $\mathrm{N} — \mathrm{C}$ bond distances of 1.9208 (13), 1.288 (2) and 1.472 (2) $\AA$, respectively, are in accordance with the reported values for similar $\mathrm{Co}^{\text {III }}$ imine type macrocyclic complexes [2,9-dimethyl-3,10- di-phenyl-1,4,8,11-tetraazacyclotetradeca-1,3,8,10-tetraene)cobalt(III); $\mathrm{Co}-\mathrm{N}, \mathrm{N}=\mathrm{C}$ and $\mathrm{N}-\mathrm{C}$ distances are 1.923 (13), 1.278 (3) and 1.478 (3) Å, respectively] (Baird et al., 1993). The N2, C4, C5 $5^{\mathrm{i}}, \mathrm{C} 6^{\mathrm{i}}$ and $\mathrm{N} 1^{\mathrm{i}}$ atoms form an envelope geometry in which the triangle defined by atoms $\mathrm{C} 4, \mathrm{C} 5^{\mathrm{i}}$ and $\mathrm{C}^{\mathrm{i}}$ is canted by $60.77(11)^{\circ}$ with respect to the least square plane defined by $\mathrm{N} 1^{\mathrm{i}}, \mathrm{C} 6^{\mathrm{i}}, \mathrm{C} 4$ and N 2 atoms [symmetry code: (i) $-x+1,-y+1,-z+2$ ]. No remarkable intercationic or cation-anion interactions are found in the crystal.

## S2. Experimental

The title compound was synthesized according to the method reported by Jackels et al. (1972). Elemental analysis calculated for $\mathrm{C}_{14} \mathrm{H}_{24} \mathrm{~N}_{4} \mathrm{Br}_{3} \mathrm{Co}$ : C 30.74, H 4.42 , N $10.42 \%$. Found: C 30.40, H 4.50, N $10.04 \%$. ESI-TOF MS (positive ion, methanol): $\mathrm{m} / \mathrm{z} 466.9\left[M^{+}\right]$. IR ( $v, \mathrm{~cm}^{-1}$ ): 3204(w), 2980(m), 2933(s), 2889(s), 2766(w), 2005(m), 1615(w), 1597(m), $1476(\mathrm{~m}), 1461(\mathrm{~s}), 1426(\mathrm{~m}), 1408(\mathrm{~m}), 1372(\mathrm{w}), 1333(\mathrm{w}), 1288(\mathrm{~m}), 1214(\mathrm{~s}), 1187(\mathrm{~m}), 1026(\mathrm{~m}), 938(\mathrm{~s}), 868(\mathrm{~m}), 831(\mathrm{w})$, $806(\mathrm{w}), 777(s), 560(\mathrm{w}), 444(s)$. Recrystallization of the crude product by a method reported in the same paper resulted in the formation of dark green crystals suitable for X-ray diffraction analysis.

## S3. Refinement

All H atoms were placed in idealized positions (methyl $\mathrm{C}-\mathrm{H}=0.96 \AA$, methylene $\mathrm{C}-\mathrm{H}=0.97 \AA$ ), and included in the refinement in a riding-model approximation, with $U_{\text {iso }}(\mathrm{H})=1.5 U_{\text {eq }}\left(\right.$ methyl C) and $U_{\text {iso }}(\mathrm{H})=1.2 U_{\text {eq }}($ methylene C). In the final difference Fourier map, the highest peak was located $0.97 \AA$ from atom Br1. The deepest hole was located $1.92 \AA$ from atom Br 1 .

Extinction coefficient: 0.036 (4)

## Special details

Experimental. The first 50 frames were rescanned at the end of data collection to evaluate any possible decay phenomenon. Since it was judged to be negligible, no decay correction was applied to the data.
Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
Least-squares planes ( $x, y, z$ in crystal coordinates) and deviations from them (* indicates atom used to define plane)
$4.5770(0.0058) x+4.5950(0.0059) y-3.7053(0.0042) z=0.8322(0.0063)$

* 0.0209 ( 0.0009 ) C4 * -0.0208 (0.0009) C6_\$1 * $-0.0182(0.0008) \mathrm{N} 2 * 0.0181(0.0008) \mathrm{N} 1 \_\$ 1$

Rms deviation of fitted atoms $=0.0195$

- 2.0878 (0.0161) $x+6.6317$ (0.0050) $y-1.8850(0.0100) z=2.7313$ (0.0098)

Angle to previous plane (with approximate e.s.d.) $=60.77(0.11)$

* $0.0000(0.0000) \mathrm{C} 4$ * $0.0000(0.0000) \mathrm{C} 5 \_\$ 1$ * 0.0000 ( 0.0000 ) C6_\$1

Rms deviation of fitted atoms $=0.0000$
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors $(\mathrm{gt})$ etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
