## $\mathrm{Bis}($ dimethyl sulfoxide- $\kappa \mathrm{O}$ )bis(mercapto-acetato- $\left.\kappa^{2} O, S\right)$ tin(IV)

## Li Song

Department of Chemistry, Key Laboratory of Advanced Textile Materials and Manufacturing Technology of the Ministry of Education, Zhejiang Sci-Tech University, Hangzhou 310018, People's Republic of China
Correspondence e-mail: songli@zstu.edu.cn
Received 21 October 2009; accepted 22 October 2009
Key indicators: single-crystal X-ray study; $T=130 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.003 \AA$; $R$ factor $=0.020 ; w R$ factor $=0.047$; data-to-parameter ratio $=20.7$.

In the title compound, $\left[\mathrm{Sn}\left(\mathrm{C}_{2} \mathrm{H}_{2} \mathrm{O}_{2} \mathrm{~S}\right)_{2}\left(\mathrm{C}_{2} \mathrm{H}_{6} \mathrm{OS}\right)_{2}\right]$, the mercaptoacetato ligands chelate to $\mathrm{Sn}^{\mathrm{IV}}$ through S and one O atoms. The metal centre is also coordinated by two dimethyl sulfoxide (DMSO) ligands through the O atom, leading to an overall distorted octahedral coordination environment for the $\mathrm{Sn}^{\mathrm{IV}}$ atom. The molecular adduct lies on a twofold rotation axis.

# $\mathrm{Bis}\left(\right.$ dimethyl sulfoxide- $\kappa$ O) bis(mercaptoacetato- $\kappa^{2} \mathrm{O}, \mathrm{S}$ ) tin(IV) 

## Li Song

## S1. Comment

Compared with organotin compounds, inorganic compounds of tin are also important in industry applications, for example, electroplating, ceramic glazes and pigments,heterogeneous catalysts, gas sensors, and so on. (Smith et al., 1998) Perhaps the most important recent development in tin (iv) chemistry has been the increase in studies of the solid state properties of tin (iv) compounds. $\mathrm{Sn}\left(\mathrm{SCH}_{2} \mathrm{CH}_{2} \mathrm{~S}\right)_{2}$ could act as a typical Lewis acid and reveal to be a electron acceptor. And many structures have been reported to exhibit the reaction of $\mathrm{Sn}\left(\mathrm{SCH}_{2} \mathrm{CH}_{2} \mathrm{~S}\right)_{2}$ and ligands. (Wu et al., 2000; Holmes et al., 1988) Here, the S-contained chelated ligand is mercapto acetic acid but not 1,2-ethanedithiol ligand, and the solvent DMSO act as the second ligand.
The title compound, $\mathrm{Sn}\left(\mathrm{C}_{2} \mathrm{H}_{2} \mathrm{O}_{2} \mathrm{~S}\right)_{2}(\mathrm{DMSO})_{2}$, is a mononuclear structure and crystallizes in monoclinic form in the space group $C 2 / c$. As shown in Figure 1, the asymmetric unit is composed of half tin atom, one mercaptoacetato and one DMSO ligand. According to a $C 2$ symmetry axis pass the tin (iv) site, a mononuclear structure is present. In which, two mercaptoacetato ligands coordinates to $\mathrm{Sn}^{\mathrm{rV}}$ through S and one O atoms. The metal centre is also coordinated by two dimethyl sulfoxide ligands through O atom, froming a $\mathrm{SnO}_{4} \mathrm{~S}_{2}$ distorted octahedronal coordianted sphere. Around the metal centre, two mercaptoacetato ligands adopt cis chelated mode to form a $\mathrm{SnO}_{2} \mathrm{~S}_{2}$ distorted equatorial plan. And other two DMSO ligands join on it from two polars of the coordinated sphere, also with cis mode around the metal centre.

## S2. Experimental

All chemicals were obtained from commercial sources and were used as received. The title compound was handily synthesized by a solution reaction from mercapto acetic acid. $\mathrm{HSCH}_{2} \mathrm{COOH}(56 \mathrm{mg}, 0.6 \mathrm{mmol})$ and $\mathrm{NaOH}(50 \mathrm{mg}, 1.2$ $\mathrm{mmol})$ was dissolved in 10 ml of water. To this solution was added a 5 ml aqueous solution of $\mathrm{SnCl}_{4} .5 \mathrm{H}_{2} \mathrm{O}(106 \mathrm{mg}, 0.3$ mmol ) at room temperature. Amount of white precipitates were gradually formed and colected by filtrating and washing with water. Then they were dissolved in 5 ml DMSO and the filtration was slowly evaperated at room temperature. After several days, a great deal of colorless crystals were obtained, yield about $113 \mathrm{mg}(83 \%$ on tin).

## S3. Refinement

The structure was solved using direct methods and refined by full-matrix least-squares techniques. All non-hydrogen atoms were assigned anisotropic displacement parameters in the refinement. All hydrogen atoms were added at calculated positions and refined using a riding model. The structure was refined on F2 using SHELXTL97 software package(Sheldrick et al., 2008) without any unusual events.

Figure 1
Structure and labeling of the title compound, with displacement ellipsoids drawn at the $30 \%$ probability level and H atoms shown as small spheres of arbitrary radii.

## Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors(gt) etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
