Received 9 October 2009; accepted 25 October 2009
Key indicators: single-crystal X-ray study; $T=298 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.005 \AA$; $R$ factor $=0.031 ; w R$ factor $=0.080 ;$ data-to-parameter ratio $=13.9$.

The title compound, $\left[\mathrm{Cu}\left(\mathrm{C}_{9} \mathrm{H}_{9} \mathrm{BrNO}_{2}\right)_{2}\right]$, is a centrosymmetric mononuclear copper(II) complex. The Cu atom is fourcoordinated in a trans- $\mathrm{CuN}_{2} \mathrm{O}_{2}$ square-planar geometry by two phenolate O and two oxime N atoms from two symmetryrelated $N, O$-bidentate ( $E$ )-4-bromo-2-(ethoxyiminomethyl)phenolate oxime-type ligands. An interesting feature of the crystal structure is the centrosymmetric intermolecular $\mathrm{Cu} \cdots \mathrm{O}$ interaction [3.382 (1) $\AA$ ] , which establishes an infinite chain structure along the $b$ axis.

## S1. Comment

Oximes are a traditional class of chelating ligands widely used in coordination and analytical chemistry and extraction metallurgy (Kukushkin et al., 1996; Chaudhuri, 2003). Due to their marked ability to from bridges between metal ions, oxime-containing ligands may be used to obtain polynuclear compounds in the field of molecular magnetism and supramolecular chemistry (Cervera et al., 1997; Costes et al., 1998). As a continuation of our study (Wang et al., 2008; Zhao et al., 2009) on oxime-type compounds, the title mononuclear copper(II) complex (Fig. 1), is reported in this paper. The title compound is a centrosymmetric mononuclear copper(II) complex. The copper(II) ion, lying on the inversion centre, is four-coordinated in a trans- $\mathrm{CuN}_{2} \mathrm{O}_{2}$ square-planar geometry, with two phenolate O and two oxime N atoms from two $\mathrm{N}, O$-bidentate oxime-type ligands. All bond lengths and angles are within normal ranges. The $\mathrm{Cu}-\mathrm{O}$ and $\mathrm{Cu}-$ N bond lengths are 1.880 (2) $\AA$ and 1.994 (3) $\AA$, respectively, which are comparable to those observed in a similar Schiff base copper(II) complex (Dong et al., 2009).
The interesting feature of the crystal structure, as shown in Fig. 2, is the centrosymmetric intermolecular $\mathrm{Cu} \cdots \mathrm{O}[3.382$ (1) $\AA$ ] interaction, which forms an infinite one-dimensional chain structure along the $b$ axis.

## S2. Experimental

( $E$ )-5-Bromo-2-hydroxybenzaldehyde $O$-ethyl oxime (HL) was synthesized according to the analogous method (Wang et al., 2008; Zhao et al., 2009). A blue solution of copper(II) acetate monohydrate ( $1.7 \mathrm{mg}, 0.008 \mathrm{mmol}$ ) in methanol ( 3 ml ) was added dropwise to a solution of $\mathrm{HL}(2.1 \mathrm{mg}, 0.009 \mathrm{mmol})$ in methanol $(4 \mathrm{ml})$ at room temperature. The color of the mixing solution turned to yellow immediately, then turned to brown slowly and was allowed to stand at room temperature for several days. With evaporation of the solvent, dark-brown needle-like single crystals suitable for X-ray crystallographic analysis were obtained. IR: $v \mathrm{C}=\mathrm{N}, 1608 \mathrm{~cm}^{-1}, v \mathrm{Ar}-\mathrm{O}, 1242 \mathrm{~cm}^{-1}, v \mathrm{Cu}-\mathrm{N}, 445 \mathrm{~cm}^{-1}$ and $v \mathrm{Cu}-\mathrm{O}$, $424 \mathrm{~cm}^{-1}$. Yield, $47.1 \%$. Anal. Calcd. for $\mathrm{C}_{18} \mathrm{H}_{18} \mathrm{Br}_{2} \mathrm{CuN}_{2} \mathrm{O}_{4}$ : C, 39.33; H, 3.30; $\mathrm{Cu}, 11.56 ; \mathrm{N}, 5.10$. Found: C, 39.20; H, 3.38; Cu, 11.62; N, 4.87.

## S3. Refinement

Non-H atoms were refined anisotropically. H atoms were treated as riding atoms with distances $\mathrm{C}-\mathrm{H}=0.96 \AA\left(\mathrm{CH}_{3}\right)$, $0.97 \AA\left(\mathrm{CH}_{2}\right)$ and $0.93 \AA(\mathrm{CH})$. The isotropic displacement parameters for all H atoms were set equal to 1.2 or $1.5 U_{\text {eq }}$ of the carrier atom.

Figure 1
The molecular structure of the title compound with the atom numbering scheme [Symmetry codes: $-x+1,-y+1,-z+1$ ]. Unlabelled atoms are related to their labelled counterparts by the inversion operation. Displacement ellipsoids for nonhydrogen atoms are drawn at the $30 \%$ probability level.

Figure 2
Packing diagram for the title compound, showing an infinite one-dimensional chain structure formed by short $\mathrm{Cu} \cdots \mathrm{O}$ contact viewed along the $b$ axis. H atoms not involved in hydrogen bonding have been omitted for clarity.

## Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors(gt) etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
