Received 9 October 2009; accepted 13 October 2009

Key indicators: single-crystal X-ray study;  $T = 299\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.003\text{ \AA}$ ;  $R$  factor = 0.037;  $wR$  factor = 0.108; data-to-parameter ratio = 16.1.

In the title compound,  $\text{C}_{14}\text{H}_{15}\text{NO}_2\text{S}$ , the dihedral angle between the aromatic rings is  $40.4(1)^\circ$  relative to each other. In the crystal, inversion dimers linked by pairs of  $\text{N}-\text{H}\cdots\text{O}$  hydrogen bonds occur.

### Related literature

## N-(2,5-Dimethylphenyl)benzenesulfonamide

B. Thimme Gowda, Sabine Foro, P. G. Nirmala and Hartmut Fuess

### S1. Comment

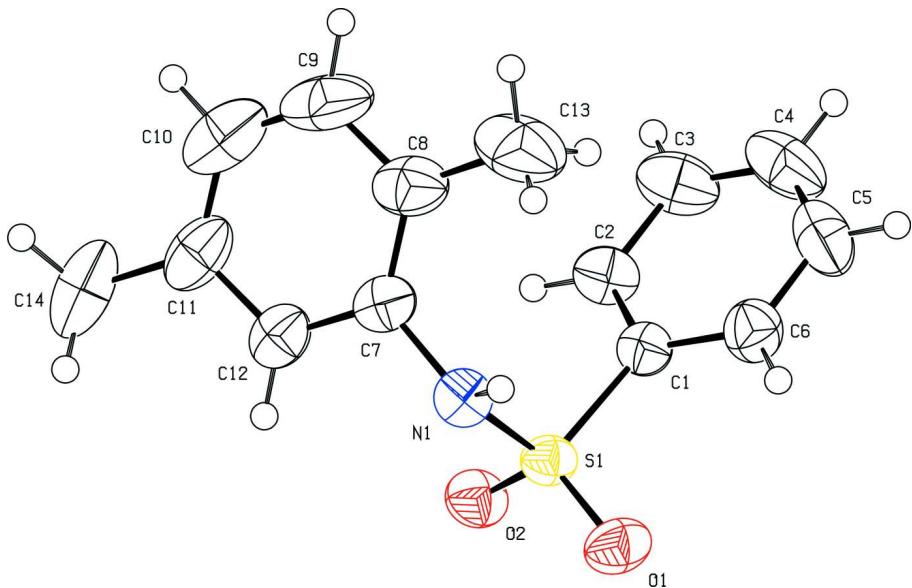

In the present work, as part of a study of substituent effects on the structures of *N*-(aryl)-arylsulfonamides, the structure of *N*-(2,5-dimethylphenyl)benzenesulfonamide (I) has been determined (Gowda *et al.*, 2008a, 2008b, 2009). The conformation of the N—C bond in the C—SO<sub>2</sub>—NH—C segment has *gauche* torsions with the S=O bonds (Fig. 1). The molecule is bent at the S atom with the C—SO<sub>2</sub>—NH—C torsion angle of 62.7 (2)°. The two benzene rings in (I) are tilted relative to each other by 40.4 (1)°, compared to the values of 61.5 (1)° in *N*-(2-methylphenyl)benzenesulfonamide (II) (Gowda *et al.*, 2008b), 64.8 (1)° in *N*-(2,3-dimethylphenyl)-benzenesulfonamide (III) (Gowda *et al.*, 2009) and 44.9 (1)° in *N*-(2,6-dimethylphenyl)benzenesulfonamide (IV) (Gowda *et al.*, 2008a). The other bond parameters are similar to those observed in (II), (III), (IV) and other aryl sulfonamides (Perlovich *et al.*, 2006; Gelbrich *et al.*, 2007). The crystal packing of (I) showing dimers linked *via* N—H···O(S) hydrogen bonds (Table 1) is given in Fig.2.

### S2. Experimental

A solution of benzene (10 ml) in chloroform (40 ml) was treated dropwise with chlorosulfonic acid (25 ml) at 0 °C. After the initial evolution of hydrogen chloride subsided, the reaction mixture was brought to room temperature and poured into crushed ice in a beaker. The chloroform layer was separated, washed with cold water and allowed to evaporate slowly. The residual benzenesulfonylchloride was treated with 2,5-dimethylaniline in the stoichiometric ratio and boiled for ten minutes. The reaction mixture was then cooled to room temperature and added to ice cold water (100 ml). The resultant solid *N*-(2,5-dimethylphenyl)benzenesulfonamide was filtered under suction and washed thoroughly with cold water. It was then recrystallized to constant melting point from dilute ethanol. The purity of the compound was checked and characterized by recording its infrared and NMR spectra (Gowda *et al.*, 2005). The single crystals used in X-ray diffraction studies were grown in ethanolic solution by a slow evaporation at room temperature.

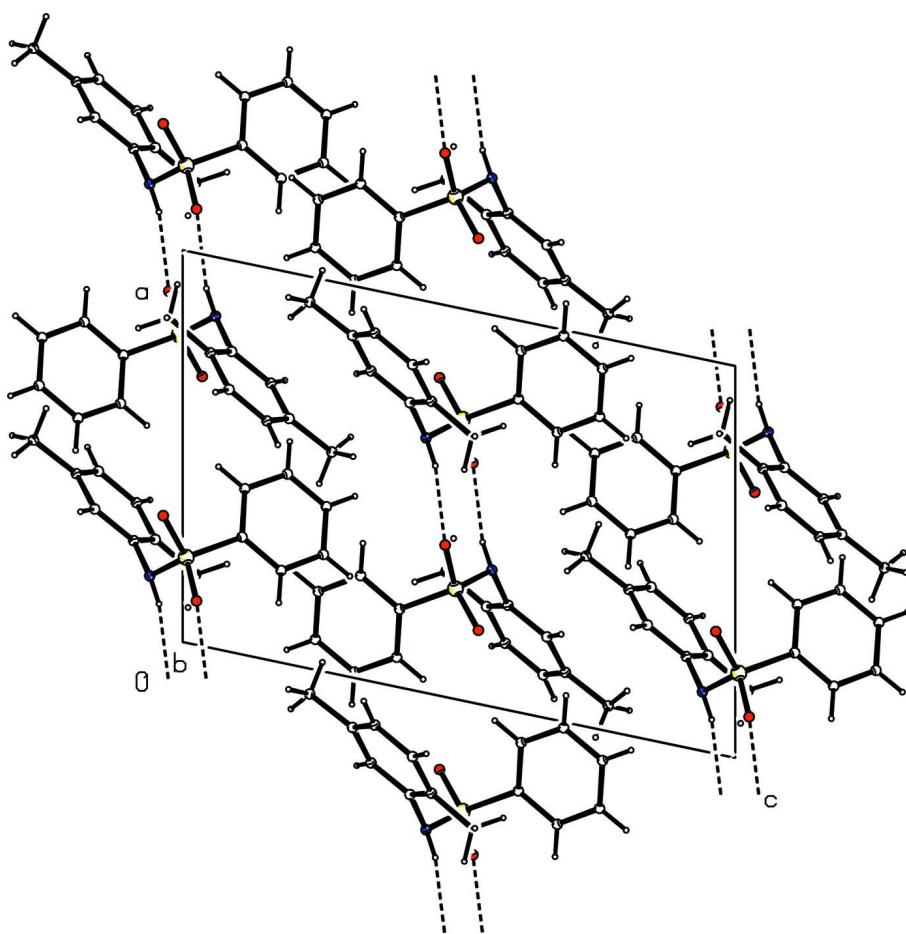

### S3. Refinement

The H atom of the NH group was located in a difference map and its position refined with N—H = 0.83 (2) Å. The other H atoms were positioned with idealized geometry using a riding model with C—H = 0.93–0.96 Å. All H atoms were refined with isotropic displacement parameters (set to 1.2 times of the  $U_{eq}$  of the parent atom).

**Figure 1**

Molecular structure of (I), showing the atom labelling scheme and displacement ellipsoids are drawn at the 50% probability level.

**Figure 2**

Molecular packing of (I) with hydrogen bonding shown as dashed lines, viewed down the *b* axis.

#### Crystal data

$C_{14}H_{15}NO_2S$   
 $M_r = 261.33$   
Monoclinic,  $P2_1/n$   
Hall symbol: -P 2yn  
 $a = 10.523 (1)$  Å  
 $b = 8.5631 (7)$  Å  
 $c = 15.135 (2)$  Å  
 $\beta = 101.86 (1)^\circ$   
 $V = 1334.7 (2)$  Å<sup>3</sup>  
 $Z = 4$

$F(000) = 552$   
 $D_x = 1.301 \text{ Mg m}^{-3}$   
Mo  $K\alpha$  radiation,  $\lambda = 0.71073$  Å  
Cell parameters from 2374 reflections  
 $\theta = 2.6\text{--}27.8^\circ$   
 $\mu = 0.24 \text{ mm}^{-1}$   
 $T = 299 \text{ K}$   
Prism, colourless  
 $0.44 \times 0.40 \times 0.34 \text{ mm}$

#### Data collection

Oxford Diffraction Xcalibur (TM) Single Crystal X-ray Diffractometer with Sapphire CCD Detector.  
Radiation source: fine-focus sealed tube  
Graphite monochromator  
Detector resolution: 0 pixels mm<sup>-1</sup>

Rotation method data acquisition using  $\omega$  and phi scans.  
Absorption correction: multi-scan (*CrysAlis RED*; Oxford Diffraction, 2009)  
 $T_{\min} = 0.903$ ,  $T_{\max} = 0.924$   
5236 measured reflections

2727 independent reflections  
 2221 reflections with  $I > 2\sigma(I)$   
 $R_{\text{int}} = 0.010$   
 $\theta_{\text{max}} = 26.4^\circ, \theta_{\text{min}} = 2.6^\circ$

$h = -10 \rightarrow 13$   
 $k = -10 \rightarrow 7$   
 $l = -17 \rightarrow 18$

#### Refinement

Refinement on  $F^2$   
 Least-squares matrix: full  
 $R[F^2 > 2\sigma(F^2)] = 0.037$   
 $wR(F^2) = 0.108$   
 $S = 1.10$   
 2727 reflections  
 169 parameters  
 0 restraints  
 Primary atom site location: structure-invariant direct methods  
 Secondary atom site location: difference Fourier map

Hydrogen site location: inferred from neighbouring sites  
 H atoms treated by a mixture of independent and constrained refinement  
 $w = 1/[\sigma^2(F_o^2) + (0.0568P)^2 + 0.2974P]$   
 where  $P = (F_o^2 + 2F_c^2)/3$   
 $(\Delta/\sigma)_{\text{max}} = 0.001$   
 $\Delta\rho_{\text{max}} = 0.27 \text{ e } \text{\AA}^{-3}$   
 $\Delta\rho_{\text{min}} = -0.26 \text{ e } \text{\AA}^{-3}$   
 Extinction correction: *SHELXL*,  
 $F_c^* = kFc[1 + 0.001xFc^2\lambda^3/\sin(2\theta)]^{-1/4}$   
 Extinction coefficient: 0.0149 (18)

#### Special details

**Experimental.** Empirical absorption correction using spherical harmonics, implemented in SCALE3 ABSPACK scaling algorithm

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
