## 4-Bromo-N, $\mathrm{N}^{\prime}$-bis(4-methoxyphenyl)benzamidine

Amlan K. Pal* and Garry S. Hanan<br>Département de Chimie, Université de Montréal, CP 6128, Succ. Centre-ville, Montréal, Québec, Canada H3C 3J7<br>Correspondence e-mail: amlan.kumar.pal@umontreal.ca

Received 19 August 2009; accepted 1 October 2009

Key indicators: single-crystal X-ray study; $T=150 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.002 \AA$; $R$ factor $=0.029 ; w R$ factor $=0.080 ;$ data-to-parameter ratio $=14.3$.

The title compound, $\mathrm{C}_{21} \mathrm{H}_{19} \mathrm{BrN}_{2} \mathrm{O}_{2}$, is an amidine containing electron-donating methoxy groups and a bulky Br atom on the benzene rings. The solid-state structure reveals a noncentrosymmetric molecule, with an $E$ configuration around the $\mathrm{C}=\mathrm{N}$ double bond. The $\mathrm{C}-\mathrm{N}$ bonds show distinct amine [1.3689 (19) Å] and imine [1.285 (2) Å] characteristics. In the crystal, symmetry-related molecules are linked via a very weak $\mathrm{N}-\mathrm{H} \cdots \mathrm{N}$ interaction, and $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ and $\mathrm{C}-\mathrm{H} \cdots \pi$ interactions.

## 4-Bromo- $N, N^{\prime}$ 'bis(4-methoxyphenyl)benzamidine

Amlan K. Pal and Garry S. Hanan

## S1. Comment

Benzamidine ligands are of immense importance as amidinate complexes with dimetallic units (like Rh, Mo) can act as chromophores in light-harvesting devices (Chartrand \& Hanan, 2008).

The title compound (Fig. 1) is an amidine containing electron donating methoxy groups on phenyl rings A and C, and a bulky bromine atom on phenyl ring B. Motives like these are of interest due to the fact that they can be incorporated into supramolecular assemblies via coordination chemistry. The C-N bonds show distinct amine [1.3689 (19) $\AA$ for C1-N1] and imine [1.285 (2) $\AA$ for $\mathrm{C} 1=\mathrm{N} 2$ ] characteristics, which on complexation become near equivalent bonds with a higher degree of delocalization. These values are similar to the values found in $N, N^{\prime}$-diphenylbenzamidine [1.302 (7) $\AA$ and 1.360 (8) $\AA$, respectively](Alcock et al., 1988) and 4-methoxy- $N, N^{\prime}$-diphenylbenzamidine [1.283 (2) $\AA$ and 1.372 (2) $\AA$, respectively] (Bortoluzzi et al., 2004), but differ to those found in $N, N^{\prime}$-diphenylbenzamidinium nitrate [1.3266 (18) $\AA$ ] (Barker et al., 1999).
It is already known that the difference between $\mathrm{C}-\mathrm{N}$ and $\mathrm{C}=\mathrm{N}$ depends on the degree of delocalisation in the $\mathrm{N}-\mathrm{C}=\mathrm{N}$ skeleton. In the title compound the difference is $0.0839 \AA$, whereas it is $0.058 \AA$ in $N, N^{\prime}$-diphenylbenzamidine (Alcock et al., 1988), $0.046 \AA$ in acetamidine (Norrestam and Mertz, 1983), and $0.06 \AA$ in $N, N$ 'di( $p$-tolyl)benzamidine (Alcock et al., 1994). This correlation clearly proves that the degree of delocalisation depends on the substituents on the phenyl rings. In the title compound the bromine atom and the methoxy groups strongly influence the $\mathrm{N}-\mathrm{C}=\mathrm{N}$ congugation $(0.0839 \AA)$, in comparison with the unsubstituted compound $N, N^{\prime}$-diphenylbenzamidine ( $0.058 \AA$ ).

From the torsion angles, $\mathrm{C} 8-\mathrm{N} 1-\mathrm{C} 1-\mathrm{N} 2=13.9(3)^{\circ}$ and $\mathrm{C} 8-\mathrm{N} 1-\mathrm{C} 1-\mathrm{C} 2=166.9(14)^{\circ}$, it is revealed that the $\mathrm{H}-\mathrm{atom}, \mathrm{H} 1$, along with atom N 1 and the phenyl substituent (ring A) at N 2 are in an $E$ (trans) configuration with respect to $\mathrm{C} 1=\mathrm{N} 2$ bond. The solid state structure of the title compound indicates that the imine lone pair and the N1-H1 bond are on opposite sides of the molecule. This orientation hinders self association to give cyclic dimer formation, as observed in $N, N^{\prime}$-di(p-chlorophenyl)formamidine (Cotton et al., 1997). The widening of the N1-C1-N2 bond angle [121.89 (14) ${ }^{\circ}$ ] and the slight deviation from the ideal $\mathrm{sp}^{2}$ bond angle $\left(120^{\circ}\right)$, also observed in $N, N^{\prime}$-diphenylbenzamidine $\left(120.4^{\circ}\right)$ and $N, N^{\prime}$ -di(p-tolyl)benzamidine (120.8), is assumed to be due to intermolecular interactions.
In the crystal symmetry related molecules are linked by a very weak $\mathrm{N}-\mathrm{H} \cdots \mathrm{N}$, interaction and by $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ and $\mathrm{C}-\mathrm{H} \cdots \pi$ interactions (see Table 1 for details).

## S2. Experimental

The title compound was prepared according to following procedure. A 250 ml round-bottomed flask was charged with $p$ bromobenzoic acid $(10.0 \mathrm{~g}, 49.0 \mathrm{mmol})$ and $\mathrm{SOCl}_{2}(45 \mathrm{ml})$. The resulting slurry was refluxed under a $\mathrm{N}_{2}$ atmosphere for 2 $h$ to give a clear solution. The solution was cooled to rt and the unreacted $\mathrm{SOCl}_{2}$ was removed by distillation. The residue was then dried for 2 h under vacuum to give colourless crystalline $p$-bromobenzoyl chloride ( $11.0 \mathrm{~g}, 100 \%$ ). Dry DCM $(60 \mathrm{ml})$ and dry $\mathrm{Et}_{3} \mathrm{~N}(20 \mathrm{ml}, 143 \mathrm{mmol})$ were added to the residue at 283 K under a $\mathrm{N}_{2}$ atmosphere to give a brown
precipitate. A solution of $p$-anisidine $(7.0 \mathrm{~g}, 56 \mathrm{mmol})$ in another aliquot of dry $\mathrm{DCM}(40 \mathrm{ml})$ was then added to the reaction mixture over 30 min by syringe at 283 K to give a pale brown precipitate. The flask was then fitted with a reflux condenser and the slurry was heated to reflux for 10 h and a yellowish brown precipitate formed. After 10 h the mixture was cooled to rt and then evaporated to dryness to give a yellowish brown residue. Distilled water ( 200 ml ) was then added and the resulting slurry was filtered and the solid rinsed with methanol ( $3 \times 100 \mathrm{ml}$ ) to give colourless spongy crystalline 4-bromo-4'-methoxybenzanilide ( $15 \mathrm{~g}, 98 \%$ ). (2) To a stirred solution of 4-bromo-4'-methoxybenzanilide (4.0 $\mathrm{g}, 13 \mathrm{mmol})$ in dry $\mathrm{DCM}(40 \mathrm{ml})$, in a 250 ml round-bottomed flask, was added a solution of $\mathrm{PCl}_{5}(5.0 \mathrm{~g}, 24 \mathrm{mmol})$ in dry DCM ( 30 ml ) by a syringe at 283 K under a $\mathrm{N}_{2}$ atmosphere. The resulting slurry was then allowed to come to rt and was stirred for 2 h to give a clear bright yellow solution. After 2 h a solution of $p$-anisidine ( $4.8 \mathrm{~g}, 39 \mathrm{mmol}$ ) in another aliquot of dry DCM ( 30 ml ) was added with stirring under a $\mathrm{N}_{2}$ atmosphere, maintaining the temperature at 283 K , and then the solution was allowed to reach rt. This solution was then stirred at rt for 1 h , giving pale yellow precipitate, and then was evaporated to dryness yielding a pale yellow residue, which was poured into a beaker containing basic aqueous KOH solution ( $200 \mathrm{ml}, \mathrm{pH}>12$ ) to give an off-yellow residue. This residue was then filtered off and rinsed with water (5 $\times 100 \mathrm{ml})$ and dried under vacuum. Slow evaporation of an EtOAc solution of this pale-yellow solid gave pale-yellow crystals of the title compound ( $4.6 \mathrm{~g}, 85 \%$ ). Colourless crystalline plates, suitable for X-ray analysis, were obtained by slow evaporation of a concentrated EtOAc solution of the title compound.
${ }^{1} \mathrm{H}$ NMR (DMSO- $\left.d_{6}, 400 \mathrm{MHz}, 330 \mathrm{~K}\right)$ : d $8.97(\mathrm{~b}, \mathrm{~s}, 1 \mathrm{H}), 7.76(\mathrm{~b}, \mathrm{~s}, 2 \mathrm{H}), 7.52(\mathrm{~d}, J=8 \mathrm{~Hz}, 2 \mathrm{H}), 7.21(\mathrm{~d}, J=8 \mathrm{~Hz}, 2 \mathrm{H})$, $6.85(\mathrm{~b}, \mathrm{~s}, 2 \mathrm{H}), 6.62(\mathrm{~b}, \mathrm{~s}, 2 \mathrm{H}), 6.49(\mathrm{~b}, \mathrm{~s}, 2 \mathrm{H}), 3.66(\mathrm{~d}, J=37 \mathrm{~Hz}, 6 \mathrm{H})$ p.p.m. Elemental analysis: expected for $\mathrm{C}_{21} \mathrm{H}_{19} \mathrm{~N}_{2} \mathrm{O}_{2} \mathrm{Br} ; \mathrm{C}=61.33 \%, \mathrm{H}=4.66 \%, \mathrm{~N}=6.81 \%$; found: $\mathrm{C}=61.04 \%, \mathrm{H}=4.57 \%, \mathrm{~N}=6.75 \%$.

## S3. Refinement

The H -atoms were included in calculated positions and treated as riding atoms: amine $\mathrm{N}-\mathrm{H} 0.88 \AA$, aromatic $\mathrm{C}-\mathrm{H} 0.95$ $\AA$, methyl C-H $0.98 \AA$, with $\mathrm{U}_{\text {iso }}(\mathrm{H})=\mathrm{k} \times \mathrm{U}_{\text {eq }}($ parent N - or C -atom), where $\mathrm{k}=1.2$ for the amine and aromatic H -atoms and 1.5 for the methyl H -atoms.

## Special details

Experimental. X-ray crystallographic data for I were collected from a single-crystal sample, which was mounted on a loop fiber. Data were collected using a Bruker microstar diffractometer equiped with a Platinum 135 CCD Detector, a Helios optics and a Kappa goniometer. The crystal-to-detector distance was 4.0 cm , and the data collection was carried out in $512 \times 512$ pixel mode. The initial unit-cell parameters were determined by a least-squares fit of the angular setting of strong reflections, collected by a 10.0 degree scan in 33 frames over three different parts of the reciprocal space ( 99 frames total).
Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors(gt) etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
