Received 30 September 2009; accepted 8 October 2009

Key indicators: single-crystal X-ray study; $T=296 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.003 \AA$; $R$ factor $=0.018 ; w R$ factor $=0.044 ;$ data-to-parameter ratio $=29.6$.

In the title compound, $\left(\mathrm{C}_{4} \mathrm{H}_{12} \mathrm{~N}_{2}\right)\left[\mathrm{AuCl}_{4}\right]_{2} \cdot 2 \mathrm{H}_{2} \mathrm{O}$, the $\mathrm{Au}^{\text {III }}$ atom has a square-planar geometry. The piperazinium dication lies on an inversion centre and adopts a typical chair conformation. In the crystal, a combination of $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$, $\mathrm{N}-\mathrm{H} \cdots \mathrm{Cl}$ and $\mathrm{O}-\mathrm{H} \cdots \mathrm{Cl}$ hydrogen bonds results in the formation of a three-dimensional network.

# Piperazine-1,4-diium bis[tetrachloridoaurate(III)] dihydrate 

Anna V. Polishchuk, Emilia T. Karaseva and Mikhail A. Pushilin

## S1. Comment

The asymmetric unit of the title compound consists of a discrete $\left[\mathrm{AuCl}_{4}\right]^{-}$complex anion, one water molecule and onehalf of a diprotonated piperazinium dication (Fig. 1). The Au atom in the tetrachloridoaurate anion exhibits a squareplanar coordination. A similar geometry has been observed, for exemple, in tetraphenylantimony(V) tetrachloroaurate (Sharutin et al., 2008) and bipyridinium tetrachloroaurate (Zhang et al., 2006). The $\mathrm{Au}-\mathrm{Cl}$ bond lengths are in the range of 2.2802 (6) - 2.2842 (7) $\AA$. In the crystal structure, the anions are stacked into columns along the $a$ axis, parallel to each other. The distances between anion planes are ca. 3.734 and $3.999 \AA$. The organic piperazinium dication lies at an inversion centre and adopts a typical chair geometry with normal valence bond lengths (Allen et al., 1987) and angles, as observed in the structures of piperazinediium tetrachloridozincate (Sutherland \& Harrison, 2009) and piperazinediium tetrachloridozincate monohydrate (Kefi \& Nasr, 2005).
The piperazinium dications and water molecules are linked by intermolecular bifurcated $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds to form chains proagagting along the [100] direction (Fig. 2). The water-piperaziniun chains and the anion stacks form a three-dimensional framework (Fig. 3) via bifurcated $\mathrm{N}-\mathrm{H} \cdots \mathrm{Cl}$ and $\mathrm{O}-\mathrm{H} \cdots \mathrm{Cl}$ hydrogen bonds (Table 1).

## S2. Experimental

The chemicals used were of reagent grade. Ciprofloxacin hydrochloride ( $37 \mathrm{mg}, 0.1 \mathrm{mmol}$ ) and gold(III) chloride ( $\mathrm{AuCl}_{3}$ $30 \mathrm{mg}, 0.1 \mathrm{mmol}$ ) were dissolved in 10 ml of $32 \%$ of HCl . Yellow crystals of the title compound, suitable for X-ray analysis, were obtained by slow evaporation in air at rt, after a few days.

## S3. Refinement

The water H -atoms were located from difference electron-density maps and were refined with distance restraints of $\mathrm{O}-\mathrm{H}$ $=0.85(2) \AA$ and $\operatorname{Uiso}(\mathrm{H})=1.5 \mathrm{Ueq}(\mathrm{O})$. All the other H -atoms were positioned geometrically and allowed to ride on their parent atoms: $\mathrm{N}-\mathrm{H}=0.90 \AA, \mathrm{C}-\mathrm{H}=0.97 \AA$ with $\operatorname{Uiso}(\mathrm{H})=1.2 \mathrm{Ueq}$ (parent N or C atom).

Figure 1
The asymmetric unit of the title compound, showing $50 \%$ displacement ellipsoids (arbitrary spheres for the H atoms).

Figure 2
Fragment of the water-piperazinium hydrogen bonded chain, with the hydrogen bonds indicated by dotted lines. Symmetry codes are the same as in Table 1.

Figure 3
A view along the a axis of the crystal packing of the title compound, with the hydrogen bonds shown as dotted lines. All the C-bound H atoms have been omitted for clarity. Symmetry codes are the same as in Table 1.

## Refinement

Refinement on $F^{2}$
Least-squares matrix: full
$R\left[F^{2}>2 \sigma\left(F^{2}\right)\right]=0.018$
$w R\left(F^{2}\right)=0.044$
$S=1.09$
2630 reflections
89 parameters
2 restraints
Primary atom site location: structure-invariant direct methods
Secondary atom site location: difference Fourier map

> Hydrogen site location: inferred from $\quad$ neighbouring sites
> H atoms treated by a mixture of independent $\quad$ and constrained refinement
> $w=1 /\left[\sigma^{2}\left(F_{\mathrm{o}}^{2}\right)+(0.0203 P)^{2}+0.7643 P\right]$ $\quad$ where $P=\left(F_{\mathrm{o}}^{2}+2 F_{\mathrm{c}}^{2}\right) / 3$
> $(\Delta / \sigma)_{\max }=0.002$
> $\Delta \rho_{\max }=1.36 \mathrm{e} \AA^{-3}$
> $\Delta \rho_{\min }=-0.75 \mathrm{e} \AA^{-3}$
> Extinction correction: $S H E L X L 97($ Sheldrick, $\quad 2008), \mathrm{Fc}^{*}=\mathrm{kFc}\left[1+0.001 \mathrm{xFc}^{2} \lambda^{3} / \sin (2 \theta)\right]^{-1 / 4}$
> Extinction coefficient: $0.01512(17)$

## Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two 1.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors $(\mathrm{gt})$ etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
