## 5-Amino-1-naphthol

## Agnieszka Czapik, Arkadiusz Nitka and Maria Gdaniec*

Faculty of Chemistry, Adam Mickiewicz University, 60-780 Poznań, Poland Correspondence e-mail: magdan@amu.edu.pl

Received 19 October 2009; accepted 28 October 2009
Key indicators: single-crystal X-ray study; $T=130 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.003 \AA$; $R$ factor $=0.036 ; \omega R$ factor $=0.091$; data-to-parameter ratio $=8.0$.

In the title compound, $\mathrm{C}_{10} \mathrm{H}_{9} \mathrm{NO}$, the amino and the hydroxy groups act both as a single donor and a single acceptor in hydrogen bonding. In the crystal, molecules are connected via chains of intermolecular $\cdots \mathrm{N}-\mathrm{H} \cdots \mathrm{O}-\mathrm{H} \cdots$ interactions, forming a two-dimensional polymeric structure resembling the hydrogen-bonded molecular assembly found in the crystal structure of naphthalene-1,5-diol. Within this layer, molecules related by a translation along the $a$ axis are arranged into slipped stacks via $\pi-\pi$ stacking interactions [interplanar distance $=3.450(4) \AA$ ]. The amino N atom shows $s p^{3}$ hybridization and the two attached H atoms are located on the same side of the aromatic ring.

## 5-Amino-1-naphthol

## Agnieszka Czapik, Arkadiusz Nitka and Maria Gdaniec

## S1. Comment

Amino-hydroxy group recognition has been at the focus of crystal engineering since Ermer \& Eling (1994) and Hanessian et al. (1994) noticed the complementarity of hydroxy and amino groups as regards hydrogen-bond donors and acceptors. Shortly after it was demonstrated with simple 1,2- and 1,3-aminophenols that molecular features, such as functional groups, do not necessarily result in a single manner of the molecular arrangement, and that strong $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ and $\mathrm{O}-$ $\mathrm{H} \cdots \mathrm{N}$ hydrogen bonding is frequently unable to exclude other factors from controlling the crystal packing (Allen et al., 1997; Dey et al. 2005). Here we report on the crystal structure of a simple aminonaphthol which, as regards the substitution pattern, can be considered as an analogue of 1,4-aminophenol.
The molecular structure of the title compound is shown in Fig. 1, and the geometrical parameters are available in the archived CIF. Whereas 1,4-aminophenol forms a tetrahedral network, via $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ and $\mathrm{O}-\mathrm{H} \cdots \mathrm{N}$ hydrogen bonds (Ermer \& Eling, 1994), in the title compound the molecules are connected via chains of $\cdots \mathrm{N}-\mathrm{H} \cdots \mathrm{O}-\mathrm{H} \cdots$ interactions to form a two-dimensional polymeric structure (Fig. 2, Table 1). The two-dimensional assembly of the molecules joined by hydrogen bonding resembles that formed by 1,5-dihydroxynaphthalene (Belskii et al., 1990). One amino H -atom is not involved in hydrogen bonding and does not take part in any other specific interactions.

## S2. Experimental

Single crystals of the commercially available 5-amino-1-naphthol (Aldrich) were obtained from chloroform solution by slow evaporation.

## S3. Refinement

In the absence of significant anomalous scattering effects, Friedel pairs were averaged. All H -atoms were located in electron-density difference maps. The H -atoms of the OH and NH groups were freely refined: $\mathrm{O}-\mathrm{H}=0.94$ (3) $\AA, \mathrm{N}-\mathrm{H}=$ 0.95 (3)- 0.96 (3) $\AA$. The C -bound H -atoms were placed at calculated positions, with $\mathrm{C}-\mathrm{H}=0.93 \AA$, and refined as riding on their carrier C -atom, with $\mathrm{U}_{\mathrm{iso}}(\mathrm{H})=1.2 U_{\text {eq }}(\mathrm{C})$. .

Figure 1
The molecular structure of the title compound, with displacement ellipsoids shown at the $30 \%$ probability level.

Figure 2
The crystal packing, viewed along the b-axis, of the title compound, showing the two-dimensional hydrogen-bonded assembly (hydrogen bonds are shown as dashed lines).

$\Delta \rho_{\text {min }}=-0.21$ e $\AA^{-3}$

## Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors(gt) etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
