Received 10 September 2009; accepted 25 September 2009

 Key indicators: single-crystal X-ray study; $T = 113$ K; mean $\sigma(\text{C}-\text{C}) = 0.005$ Å; R factor = 0.021; wR factor = 0.049; data-to-parameter ratio = 13.5.

The title compound, $\{[\text{Gd}(\text{C}_8\text{H}_2\text{NO}_6)(\text{H}_2\text{O})_3]\cdot\text{H}_2\text{O}\}_n$, was obtained in water under hydrothermal conditions. The Gd^{III} ions are nine-coordinated by two O and one N atoms from one pyridine-2,4,6-tricarboxylate ligand, two O atoms from another ligand, one O atom from a third ligand and three coordinated water molecules. Each ligand binds three metal centers. Two-dimensional layers are formed through the $\text{Gd}-\text{O}$ bonds and the layers are linked by $\text{O}-\text{H}\cdots\text{O}$ hydrogen bonds, forming a three-dimensional network.

Poly[[triqua(μ_3 -pyridine-2,4,6-tricarboxylato)gadolinium(III)] monohydrate]

H.-S. Wang and W.-Q. Zhang

Comment

The preparation and property researching of metal-organic frameworks have attracted widespread interest in recent years due to their potential application in the areas of magnetism, luminescence, adsorption, catalysis and so on (Parker, 2000; Tobisch, 2005; Pan *et al.*, 2003). Multicarboxylic acids containing pyridyl rings were widely used and many 1-D, 2-D and 3-D coordination polymers with novel structures have been reported. Especially, complexes with pyridine-2,4,6-tricarboxylato (H_3pta = pyridine-2,4,6-tricarboxylic acid) ligands have been recently reported (Li *et al.*, 2008; Wang *et al.*, 2007; Fu *et al.*, 2008.). The title compound is a new Gd^{III} complex built with pta ligands and prepared under hydrothermal conditions.

As shown in Fig. 1, the local geometry of Gd^{III} ion is a distorted monocapped antitetragonal prism. Each pta ligand connects three Gd^{III} ions with oxygen atoms of the carboxyl groups and the nitrogen atom. There are three coordination water molecules on each Gd^{III} ion. A two-dimensional layer is constructed by the bonding among oxygen atoms and Gd^{III} ions (see Fig. 2). In addition, a lattice water molecule per asymmetric unit is in the crystal structure. Many O—H \cdots O hydrogen bonds are formed between the oxygen atoms of water molecules and the oxygen atoms of carboxyl groups. As a result, the three-dimensional network formed by hydrogen bonds is shown in Fig. 3.

Experimental

A mixture of H_3pta (0.0422 g, 0.2 mmol), $GdCl_3 \cdot 6H_2O$ (0.0743 g, 0.2 mmol) and deionized water (15 ml) was put in a teflon-lined steel bomb and heated at 453 K for 3 days, then cooled the bomb at a rate of 2 K/hour. The colorless crystals suitable for X-ray diffraction measurements were obtained. Spectroscopic analysis: IR (KBr, ν cm^{-1}): 3606, 3382, 1631, 1608, 1582, 1549, 1445, 1395, 1352, 1277, 1235, 1110, 1025, 950, 931, 818, 791, 740, 664, 623, 587, 543, 479, 435. Elemental analysis, calculated for $C_8H_{10}GdNO_{10}$: C, 21.97; H, 2.30; N, 3.20%; found: C, 22.18; H, 2.11; N, 3.54%.

Refinement

All hydrogen atoms bonded to carbon atoms were positioned geometrically and refined as riding, with C—H = 0.95 Å and $U_{iso}(H) = 1.2U_{eq}(C)$. The H atoms of water molecules were found from difference Fourier maps and included in the final refinements with a restraint of O—H = 0.75 - 0.85 Å and $U_{iso}(H) = 1.5 U_{eq}(O)$.

Figures

Fig. 1. The molecular structure of (I), with atom labels and 30% probability displacement ellipsoids for non-H atoms.

Fig. 2. The packing of (I), showing the two-dimensional layers formed by Gd—O bonds.

Fig. 3. View of the three-dimensional network constructed by O—H...O hydrogen bonds (dashed lines). All H atoms were omitted for clarity.

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.021$	H atoms treated by a mixture of independent and constrained refinement
$wR(F^2) = 0.049$	$w = 1/[\sigma^2(F_o^2) + (0.0242P)^2]$
$S = 1.04$	where $P = (F_o^2 + 2F_c^2)/3$
2776 reflections	$(\Delta/\sigma)_{\max} = 0.001$
206 parameters	$\Delta\rho_{\max} = 0.64 \text{ e } \text{\AA}^{-3}$
8 restraints	$\Delta\rho_{\min} = -1.29 \text{ e } \text{\AA}^{-3}$
Primary atom site location: structure-invariant direct methods	Extinction correction: none

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
