 Key indicators: single-crystal X-ray study; $T = 293$ K; mean $\sigma(\text{C}-\text{C}) = 0.012$ Å; R factor = 0.043; wR factor = 0.137; data-to-parameter ratio = 12.5.

In the title centrosymmetric binuclear Ag^{I} complex, $[\text{Ag}_2(\text{C}_{12}\text{H}_{10}\text{N}_4)_2](\text{ClO}_4)_2$, each Ag^{I} center is two-coordinated by one pyridine and one benzotriazole N -donor atom of two inversion-related 1-(2-pyridylmethyl)-1H-benzotriazole (L) ligands. This forms a unique box-like cyclic dimer with an intramolecular $\text{Ag}\cdots\text{Ag}$ separation of 4.479 (2) Å. Inter-molecular $\text{C}-\text{H}\cdots\text{O}$ hydrogen-bonding interactions, involving uncoordinated ClO_4^- ions, link the binuclear units, forming a two-dimensional network parallel to (10 $\bar{2}$).

Bis[μ -1-(2-pyridylmethyl)-1*H*-benzotriazole]disilver(I) bis(perchlorate)

C.-S. Liu, X.-G. Xiao and M. Hu

Comment

Numerous related bis-heterocyclic chelating or bridging ligands have been synthesized and used extensively to construct functional coordination complexes that contain different hetero-aromatic ring systems, for example, pyridine, pyrazine, quinoline, quinoxaline, pyrazole, imidazole, thiazoles and their benzo analogues (Constable, 1989; Constable & Steel, 1989; Steel, 2005). The structures of five N-containing bis-heterocyclic ligands bearing 1-substituted benzotriazole subunits, such as 1-(2-pyridylmethyl)-1*H*-benzotriazole and its Ru^{II}, Cu^{II}, Pd^{II}, Ag^I, Zn^{II} and Hg^{II} complexes, have been well documented previously (Huang *et al.* 2008; Liu, Zhou *et al.* 2008; Richardson & Steel, 2003). In our previous work, to further investigate the influences of the N-donor spatial position of pendant pyridyl group in structurally related benzotriazol-1-yl-based pyridyl ligands on the structures of their coordination complexes, two new N-containing heterocyclic ligands 1-(4-pyridylmethyl)-1*H*-benzotriazole (4-pbt) and 2-(3-pyridylmethyl)-2*H*-benzotriazole (3-pbt) were designed and prepared. Their reaction with AgNO₃ offered an one-dimensional double helical coordination polymer {[Ag(4-pbt)](NO₃)}_∞ and a centrosymmetric binuclear complex [Ag₂(3-pbt)₂(NO₃)₂], respectively (Hu *et al.* 2008; Liu, Sun *et al.* 2008). To further investigate the influence of different counter-anions on the self-assembly process of coordination complexes, we chose to use *L* to construct new functional Ag^I complexes through its reaction with AgClO₄. Here we report the crystal structure of [Ag(*L*)]₂(ClO₄)₂.

The structure of the title compound (I) consists of a centrosymmetric binuclear [Ag(*L*)]₂²⁺ unit and two uncoordinated ClO₄⁻ ions. The binuclear [Ag(*L*)]₂²⁺ cation (Fig. 1) comprises two *L* ligands and two Ag^I centers. The intramolecular non-bonding Ag...Ag separation is 4.479 (2) Å. There is only one crystallographic independent Ag^I center, which is two coordinated by two N-atom donors, one N donor being from benzotriazole ring of one *L* ligand and the other being from pyridyl ring of another *L* ligand. In this case the 14-membered dimetallo-cyclic ring is far from planar as a result of the presence of the tetrahedral methylene group of the *L* ligand. All the Ag—N bond distances are in the normal range found for similar complexes (Liu *et al.*, 2006; Liu *et al.*, 2007).

In the crystal structure adjacent discrete binuclear [Ag(*L*)]₂²⁺ units are assembled into one-dimensional chains by intermolecular C—H...O hydrogen-bonding interactions between the *L* ligands and the uncoordinated ClO₄⁻ (Table 2). The net result is a two-dimensional network running parallel to the (10 $\bar{2}$) plane (Fig. 2). In addition, the crystal structure of (I) also contains intermolecular face-to-face π ... π stacking interactions between the pyridyl ring involving N1/C2/C3/C4/C5/C6 (centroid *Cg*1) and N1A/C2A/C3A/C4A/C5A/C6A (centroid *Cg*2) of distinct *L* ligands [the centroid–centroid separation being 3.685 (1) Å, symmetry code A: $-x, -y + 1, -z + 1$], that interlink the two-dimensional sheets to form a three-dimensional framework.

Experimental

1-(2-Pyridylmethyl)-1*H*-benzotriazole (*L*) was synthesized according to the literature procedure of Liu, Sun *et al.* (2008). Complex (I) was prepared by adding a solution of *L* (0.05 mmol) in CH₃OH (10 ml) on top of an aqueous solution (15 ml) of AgClO₄ (0.1 mmol) in a test tube. Yellow single crystals suitable for X-ray structural analysis appeared at the tube wall after *ca* one month at room temperature (yield ~30% based on *L*). Elemental analysis calculated for (C₂₄H₂₀Ag₂Cl₂N₈O₈): H 2.41, C 34.52, N 13.42%; found: H 2.30, C 34.67, N 13.36%.

Refinement

H atoms were included in calculated positions and treated in the subsequent refinement as riding atoms, with C—H = 0.93 (aromatic) or 0.97 Å (methylene), with $U_{\text{iso}}(\text{H}) = 1.2 U_{\text{eq}}(\text{C})$.

Figures

Fig. 1. The molecular structure of complex (I). Displacement ellipsoids are drawn at the 30% probability level. Atoms labelled with the suffix A are generated by the symmetry operation $(-x + 1, -y + 1, -z + 1)$.

Fig. 2. A view of the two-dimensional network of complex (I), running parallel to the $(10\bar{2})$ plane, formed by the intermolecular C—H...O (fine dashed lines) interactions. For clarity, only H atoms involved in the interactions are shown.

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.043$	H-atom parameters constrained
$wR(F^2) = 0.137$	$w = 1/[\sigma^2(F_o^2) + (0.0614P)^2 + 2.0392P]$
$S = 1.08$	where $P = (F_o^2 + 2F_c^2)/3$
2484 reflections	$(\Delta/\sigma)_{\text{max}} = 0.001$
199 parameters	$\Delta\rho_{\text{max}} = 0.62 \text{ e } \text{\AA}^{-3}$
Primary atom site location: structure-invariant direct methods	$\Delta\rho_{\text{min}} = -0.53 \text{ e } \text{\AA}^{-3}$
	Extinction correction: none

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
