

trans-Dibromidobis[tris(4-chlorophenyl)-phosphine]palladium(II)

Leo Kirsten* and Gideon Steyl

Department of Chemistry, University of the Free State, Bloemfontein 9300, South Africa

Correspondence e-mail: leokirsten@gmail.com

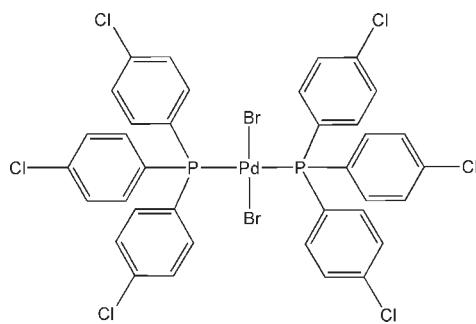

Received 21 October 2009; accepted 29 October 2009

Key indicators: single-crystal X-ray study; $T = 100\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.003\text{ \AA}$; R factor = 0.026; wR factor = 0.060; data-to-parameter ratio = 21.0.

In the title compound, $[\text{PdBr}_2(\text{C}_{18}\text{H}_{12}\text{Cl}_3\text{P})_2]$, the Pd^{II} ion is situated on a centre of symmetry and is coordinated by two Br anions [$\text{Pd}-\text{Br} = 2.4252(2)\text{ \AA}$] and two P-donor ligands [$\text{Pd}-\text{P} = 2.3317(6)\text{ \AA}$] in a slightly distorted square-planar geometry [$\text{P}-\text{Pd}-\text{Br} = 86.589(15)^\circ$].

Related literature

The title compound is isostructural with the corresponding dichlorido complex, *trans*- $[\text{PdCl}_2\{\text{P}(p\text{-ClPh})_3\}_2]$, see: Kolosova *et al.* (1986).

***trans*-Dibromidobis[tris(4-chlorophenyl)phosphine]palladium(II)**

Leo Kirsten and Gideon Steyl

S1. Comment

The title compound, (I), is one of a few literature structures containing a Pd centre coordinated by two Br atoms and two P donor ligands in a *trans* configuration. Our research is aimed at expanding the number of known structures of the aforementioned type and to finally generalize on the crystallization mode, if any, of these complexes.

The molecule of (I) (Fig. 1), is centrosymmetric with pairs of equivalent P donor ligands *trans* to one another in a slightly distorted square-planar geometry [P—Pd—Br 86.589 (15) $^{\circ}$].

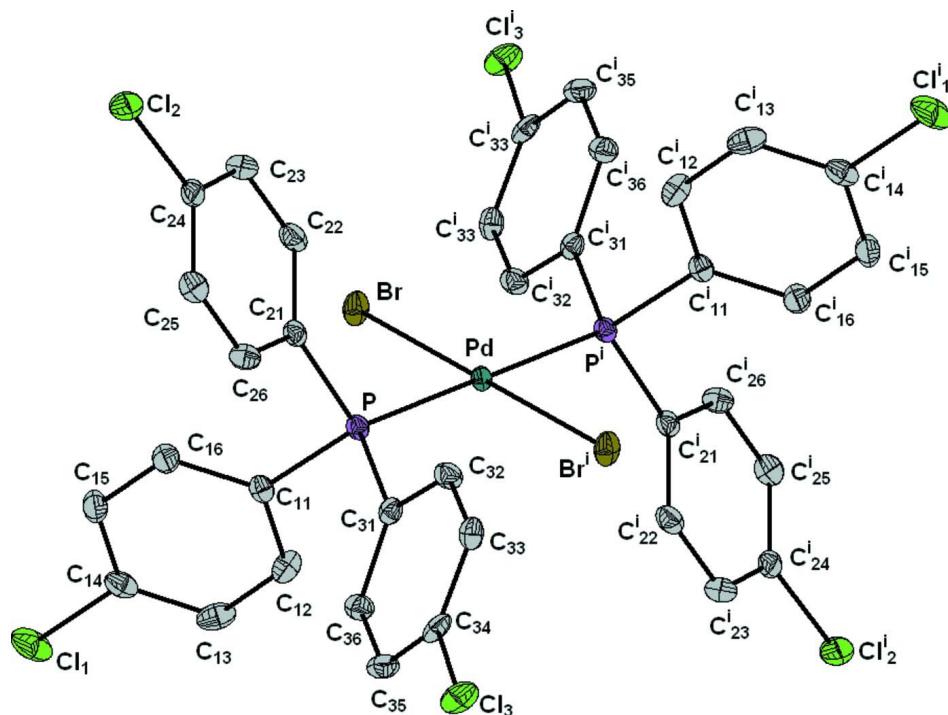

The corresponding chloro complex (Kolosova *et al.*, 1986) is iso-structural to (I) when comparing the geometrical parameters. The RMS error of 0.097 Å also indicate the iso-structurality of the two complexes (the title complex superimposed with the corresponding dichloro-palladium complex (Kolosova *et al.*, 1986) including all the atoms except the hydrogen atoms).

S2. Experimental

The title complex was synthesized by the addition of 2.2 equivalents of tris(4-Cl-phenyl)-phosphine (21 mg, 0.059 mmol) to [Pd(COD)Br₂] (10 mg, 0.026 mmol) in 10 ml of dichloromethane while stirring for 5 minutes. Slow evaporation of the solvent resulted in orange crystals suitable for X-Ray diffraction (yield 74%, 19 mg).

S3. Refinement

All H atoms were positioned geometrically and allowed to ride on their parent atoms, with C—H = 0.95 Å and $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$.

**Figure 1**

Representation of the title compound, showing the numbering scheme and displacement ellipsoids (50% probability). For the carbon rings, the first digit refers to ring number, second digit to atom in the ring. Hydrogen atoms omitted for clarity [symmetry code: (i) $1 - x, 1 - y, 1 - z$].

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
