Received 18 November 2009; accepted 20 November 2009

Key indicators: single-crystal X-ray study;  $T = 290\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.004\text{ \AA}$ ;  
 $R$  factor = 0.064;  $wR$  factor = 0.211; data-to-parameter ratio = 17.8.

In the title compound,  $\text{C}_{20}\text{H}_{18}\text{N}_4\cdot\text{CH}_3\text{COOH}$ , the benzene ring forms dihedral angles of  $81.34(11)$  and  $54.32(11)^\circ$  with the two pyridine rings. In the crystal, intermolecular  $\text{O}-\text{H}\cdots\text{N}$  hydrogen bonding links one 1,5-benzodiazepine molecule and one acetic acid solvent molecule into a dimer. These dimers, related by translation along the  $b$  axis, are further linked into chains *via* weak intermolecular  $\text{N}-\text{H}\cdots\text{N}$  hydrogen bonds.

### Related literature

For details of the synthesis and a related compound, see Hou *et al.* (2007).

## **2-Methyl-2,4-di-4-pyridyl-2,3-dihydro-1*H*-1,5-benzodiazepine acetic acid solvate**

**Shi-Chao Wang, Qiu-Fei Hou and Shi-Mei Jiang**

### **S1. Comment**

The title compound (**I**) was unexpectedly obtained during our study of the Schiff base bis-pyridine complex (Hou *et al.*, 2007). In this paper, we report its crystal structure.

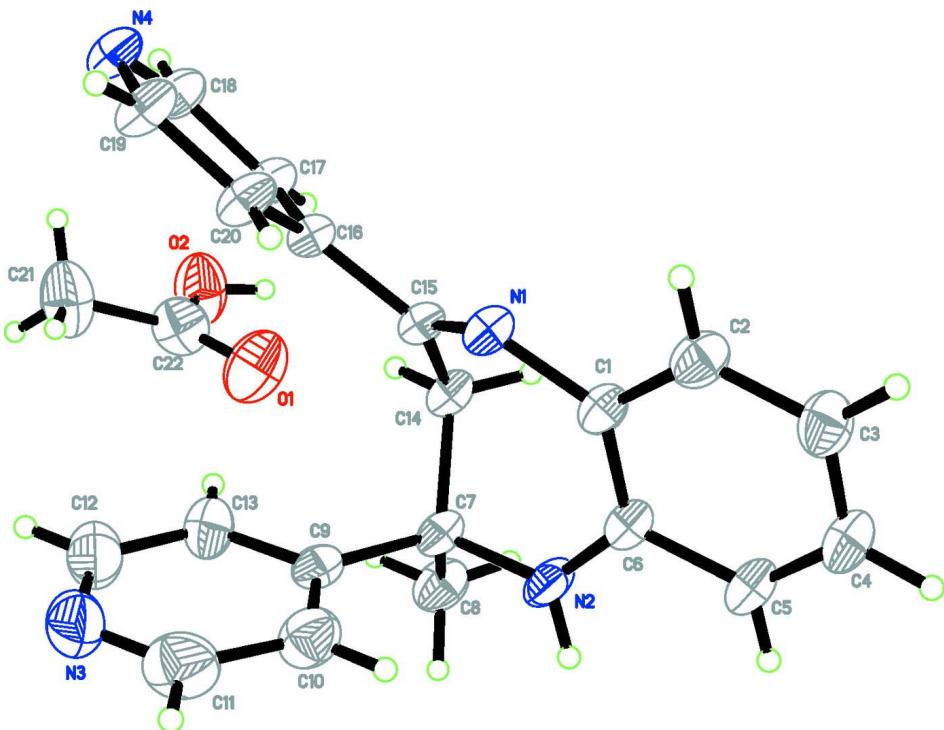

In (**I**) (Fig.1), the dihedral angles between benzene ring and two pyridine rings are 81.34 (11) ° and 54.32 (11) °, respectively. In the crystal structure, the intramolecular O—H···N and intermolecule N—H···N hydrogen bonds (Table 1) are observed.

### **S2. Experimental**

The title compound and its single crystals suitable for the X-ray diffraction were prepared by slow evaporation of the ethanol solution which contains *o*-phenylenediamine, 4-acetylpyridine and a small amount of acetic acid at room temperatue.

### **S3. Refinement**

All H atoms were placed in calculated positions (C—H 0.93 - 0.97 Å, N—H 0.86 Å, O—H 0.82 Å), and were included in the refinement in the riding model approximation, with  $U_{\text{iso}}(\text{H}) = 1.2$  or 1.5  $U_{\text{eq}}$  of the parent atom.

**Figure 1**

The asymmetric unit of the title compound showing the atomic numbering. Displacement ellipsoids of non-H atoms are drawn at the 30% probability level.

*Special details***Experimental.** (See detailed section in the paper)

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
