Received 26 October 2009; accepted 12 November 2009

Key indicators: single-crystal X-ray study; $T = 150$ K; mean $\sigma(\text{C—C}) = 0.003$ Å; R factor = 0.028; wR factor = 0.061; data-to-parameter ratio = 19.2.

The title complex, $[\text{Fe}_2(\text{C}_2\text{H}_5\text{OS})_2(\text{NO})_4]$, lies on a crystallographic inversion center. The Fe—Fe distance is characteristic of a metal–metal bond. In the crystal structure, intermolecular O—H \cdots O hydrogen bonds link complex molecules into a two-dimensional network.

H. M. Lee and S.-J. Chiou

Comment

Roussin's red esters (RREs) are photochemically active NO-release compounds and are expected to become potential NO donor drugs (Dillinger *et al.* 2007). The title compound is an air-stable and water soluble RRE compound. The molecular structure of the title complex is shown in Fig. 1. The molecule lies on a crystallographic inversion center. The Fe-Fe distance is characteristic of a M-M bond (Dillinger *et al.* 2007). In the crystal structure, intermolecular O-H \cdots O hydrogen bonds link complex molecules into a two-dimensional network.

Experimental

FeSO₄·7H₂O (5.0 g, 0.018 mol) was added to H₂SO₄ (4M, 50 ml) at 273K. To the resulting solution, the mixture of NaNO₂ (2.0 g, 0.023 mol) and mercaptoethanol (5.0 ml, 0.071 mol) were added. After stirring for 10 min, the solution was kept in refrigerator (277K) for one week. Dark red crystals formed and one was used for this structure determination. Yield: 2.1 g (65%). FTIR (THF): 1809 (w), 1774 (vs), 1748 (s) cm⁻¹ (vNO).

Refinement

All H atoms were positioned geometrically and refined as riding atoms, with C_{methylene}-H = 0.99, O-H = 0.84 Å while $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$ and $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{O})$ for all the H atoms.

Figures

Fig. 1. The molecular structure of the title complex, showing 50% displacement ellipsoids for non-H atoms. The H atoms are depicted by circles of an arbitrary radius. Unlabeled atoms of the complex are related to labeled atoms by the symmetry operator (2 - x, -y, -z).

Fig. 2. Part of the crystal structure showing intermolecular hydrogen bonds as dashed lines.

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -

factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
