Received 8 November 2009; accepted 10 November 2009

Key indicators: single-crystal X-ray study;  $T = 293\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.004\text{ \AA}$ ;  $R$  factor = 0.045;  $wR$  factor = 0.153; data-to-parameter ratio = 14.3.

In the crystal structure of the title Schiff base compound,  $\text{C}_{18}\text{H}_{20}\text{N}_2\text{O}_4\text{S}_2$ , the molecule lies across a crystallographic inversion centre. The torsion angle of the  $\text{N}-\text{C}-\text{C}-\text{N}$  fragment is  $180^\circ$ , as the inversion centre bisects the central  $\text{C}-\text{C}$  bond. The crystal packing is stabilized by  $\text{C}-\text{H}\cdots\text{O}$  hydrogen bonds and aromatic  $\pi-\pi$  stacking interactions with a centroid–centroid distance of  $3.913(2)\text{ \AA}$ .

## (E,E)-N,N'-Bis[4-(methylsulfonyl)benzylidene]ethane-1,2-diamine

Shao-Song Qian and Hong-You Cui

### S1. Comment

The title compound, (I), acts as an important precursor for the synthesis of Schiff base complexes. As an extension of our work on the structural characterization of Schiff base compounds, the crystal structure is reported here.

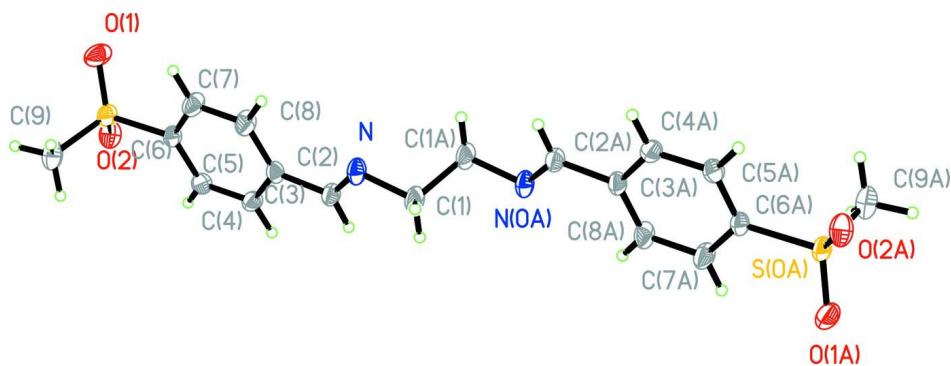

The asymmetric unit contains one-half of the molecule of (I), the other half being inversion-related by symmetry operation ( $-x$ ,  $-y$ ,  $2-z$ ) (Fig. 1). All the bond lengths are within normal ranges (Allen *et al.*, 1987) and comparable to the values observed in other similar compounds (Qian & Cui, 2009; Sun *et al.*, 2004). The crystal packing is stabilized by C—H···O hydrogen bonds and aromatic  $\pi$ – $\pi$  stacking interactions with a centroid-centroid distance of 3.913 (2) Å (Figure 2, Table 1). The torsion angle of the N—C—C—N fragment is 180°, as the inversion centre bisects the central C—C bond.

### S2. Experimental

4-(methylsulfonyl)benzaldehyde (0.184 g, 1 mmol) (Qian & Cui, 2009) and ethylene diamine (0.03 g, 0.5 mmol) were dissolved in acetonitrile (20 ml). The mixture was stirred at room temperature for 10 min to give a clear yellow solution. After keeping the solution in air for 10 d, yellow block-shaped crystals of (I) were formed at the bottom of the vessel on slow evaporation of the solvent.

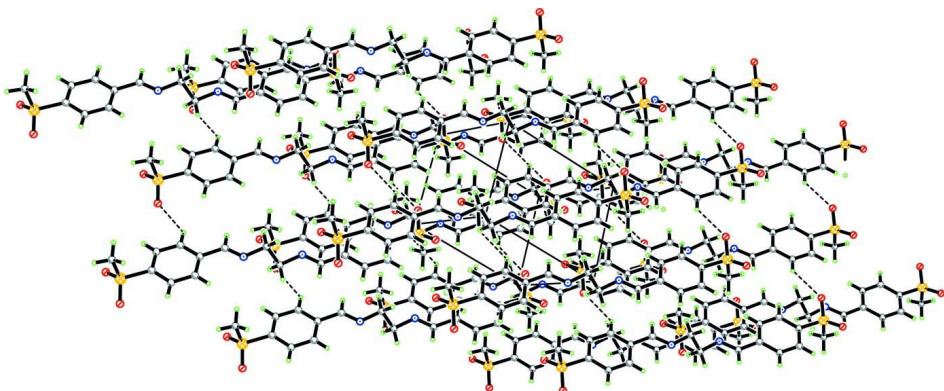

### S3. Refinement

All H atoms were placed in geometrical positions and constrained to ride on their parent atoms with C—H distances in the range 0.93–0.96 Å. They were treated as riding atoms, with  $U_{\text{iso}}(\text{H}) = kU_{\text{eq}}(\text{C})$ , where  $k = 1.5$  for methyl and 1.2 for all other H atoms.

**Figure 1**

The structure of (I), showing the atom-labelling scheme. Displacement ellipsoids are drawn at the 35% probability level. The molecule is completed by symmetry operation ( $-x$ ,  $-y$ ,  $2-z$ ) across the central C—C bond.

**Figure 2**

Plot of the crystal packing of compound (I). C—H···O hydrogen bonds are indicated with dotted lines.

intensity decay: 1%

#### Refinement

Refinement on  $F^2$   
Least-squares matrix: full  
 $R[F^2 > 2\sigma(F^2)] = 0.045$   
 $wR(F^2) = 0.153$   
 $S = 1.00$   
1683 reflections  
118 parameters  
0 restraints  
Primary atom site location: structure-invariant  
direct methods

Secondary atom site location: difference Fourier  
map  
Hydrogen site location: inferred from  
neighbouring sites  
H-atom parameters constrained  
 $w = 1/[\sigma^2(F_o^2) + (0.1P)^2 + 0.140P]$   
where  $P = (F_o^2 + 2F_c^2)/3$   
 $(\Delta/\sigma)_{\max} < 0.001$   
 $\Delta\rho_{\max} = 0.20 \text{ e } \text{\AA}^{-3}$   
 $\Delta\rho_{\min} = -0.33 \text{ e } \text{\AA}^{-3}$

*Special details*

**Geometry.** All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted R-factor wR and goodness of fit S are based on  $F^2$ , conventional R-factors R are based on F, with F set to zero for negative  $F^2$ . The threshold expression of  $F^2 > 2\text{sigma}(F^2)$  is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on  $F^2$  are statistically about twice as large as those based on F, and R-factors based on ALL data will be even larger.
